## UNESCO

The constitution of the United Nations Educational, Scientific and Cultural Organization (UNESCO) was adopted by 20 countries at the London Conference in November 1945 and entered into effect on 4 November 1946. The Organization currently has 193 Member States and 7 Associate Members.

The main objective of UNESCO is to contribute to peace and security in the world by promoting collaboration among nations through education, science, culture and communication in order to foster universal respect for justice, the rule of law, and human rights and fundamental freedoms that are affirmed for the peoples of the world, without distinction of race, sex, language or religion, by the Charter of the United Nations.

To fulfill its mandate, UNESCO performs five principal functions: 1) prospective studies on education, science, culture and communication for tomorrow's world; 2) the advancement, transfer and sharing of knowledge through research, training and teaching activities; 3) standard-setting actions for the preparation and adoption of internal instruments and statutory recommendations; 4) expertise through technical co-operation to Member States for their development policies and projects; and 5) the exchange of specialised information.

UNESCO is headquartered in Paris, France.

### The UNESCO Institute for Statistics

The UNESCO Institute for Statistics (UIS) is the statistical office of UNESCO and is the UN depository for global statistics in the fields of education, science and technology, culture and communication.

The UIS was established in 1999. It was created to improve UNESCO's statistical programme and to develop and deliver the timely, accurate and policy-relevant statistics needed in today's increasingly complex and rapidly changing social, political and economic environments.

The UIS is based in Montreal, Canada.

## FOREWORD

The UNESCO Institute for Statistics (UIS) annually publishes the *Global Education Digest* (GED) in order to present the latest education statistics worldwide. Each year it highlights a special theme, which is analysed based on a subset of relevant indicators drawn from the statistical tables of the report. This year's edition of the Digest looks at key issues and indicators for secondary education. As the demand for secondary education continues to increase worldwide, there is also interest in the use of benchmarks and comparisons to improve the functioning and capacities of education systems at this level.

This rising demand is linked to the successful efforts of countries and the international community to achieve universal primary education and related goals. In 2009, 88% of children enrolled in primary schools reached the last grade of this level of education, compared to 81% in 1999. This change was mainly due to progress made in sub-Saharan Africa and South and West Asia, where consequently growing numbers of children are ready to make the transition to secondary education.

The GED shows that broader access to secondary education, however, represents a serious challenge in many parts of the world. The gross enrolment ratio (GER) in lower secondary education increased from 72% to 80% worldwide between 1999 and 2009, with notable increases in the Arab States and sub-Saharan Africa. Yet despite this progress, the participation rate for this level of education remains very low in sub-Saharan Africa at 43%. In addition, one-third of the world's children still live in countries where lower secondary education is formally considered compulsory but where the commitment is not met. This is especially the case in South and West Asia.

More equitable access to secondary education is another important challenge. Between 1999 and 2009, the GER for girls increased from 69% to 79% in lower secondary and from 43% to 55% in upper secondary education worldwide. However, the Arab States and sub-Saharan Africa still faced serious gender disparities at the lower secondary level, while disparities at the upper secondary level intensified in South and West Asia and sub-Saharan Africa. The Digest also examines patterns of educational attainment, out-of-school young adolescents, classroom environments, teachers and financing of secondary education.

In addition to cross-nationally comparable data compiled by the UIS, this edition presents a rich set of information from household surveys on different dimensions of secondary education. It also introduces a new indicator developed by the UIS, the effective transition rate, which reflects the likelihood of a student moving to a higher level of education regardless of repetition.

The Institute undertakes a wide range of activities in countries in order to improve the timeliness, comparability, completeness and reliability of education data. With the support of UIS staff in the field, the UIS works closely with Member States to improve data quality through networks of statisticians and policymakers. These exchanges help improve the scope and comparability of data through the use of international standards.

Hendrik van der Pol  
Director  
UNESCO Institute for Statistics

## ACKNOWLEDGEMENTS

We would like to express our gratitude to the statisticians in each country and territory who took the time to carefully respond to the UIS, UOE or WEI questionnaires, in addition to requests for clarification. These national data submissions form the basis of the information presented in the *Global Education Digest*. We would also like to express our thanks to the international organizations that supplied additional data to complement those collected directly by the UIS: in particular, the United Nations Statistics and Population Divisions, the World Bank, the Organisation for Economic Co-operation and Development (OECD), Eurostat and other specialized institutions.

This publication is prepared under the supervision of Albert Motivans, Head of Education Indicators and Data Analysis.

Under the coordination of Hiromichi Katayama, authors contributing to the report were: Redouane Assad, Sheena Bell, Talal El Hourani, Amélie Gagnon, Friedrich Huebler, Hiromichi Katayama, Weixin Lu, Jean-Claude Ndabananiye, Saïd Ould Voffal, Héléne Tran, Nhung Truong and Peter Wallet. Yanhong Zhang from the United Nations Economic and

Social Commission for Asia and the Pacific (ESCAP) provided additional analyses, and Massimo Amadio from the UNESCO International Bureau of Education (IBE) made valuable contributions to the research. The analytical chapter was edited by Alison Clayson and Amy Otchet. Thanks is given to the many reviewers of the report, including Alison Kennedy.

Led by Peter Wallet, the data were prepared by: Chiao-Ling Chien, Amélie Gagnon, Weixin Lu and Wendy Xiaodan Weng, with the collaboration of Lory Ajamian, Miguel Ibañez Salinas, Xiaobao Lin, Simon Normandeau, Ioulia Sementchouk, Hanna Taleb and Héléne Tran. Contributions to data quality were provided by: Wilfried Amoussou-Guenou, Redouane Assad, Andrew Barton, Maria Helena Capelli Miguel, Hugo Castellano Tolmos, Ghania Djafri, Daniel Ejov, Tin Nam Ho, Adolfo Gustavo Imhof, Olivier Labé, Marietta Nkweta, John Pacifico, Pascale Ratovondrahona, Markus Schwabe, Anuja Singh, Konstantin Soushko-Bortsov, and UIS field-based staff.

Katja Frostell coordinated the content and overall production of the Digest, while Adriano Miele managed the production of the CD-ROM.

## FOCUS ON SECONDARY EDUCATION: THE NEXT GREAT CHALLENGE

### Introduction

Secondary education is becoming a growing concern and major challenge for education policymakers and researchers worldwide as it plays an increasingly important role in creating healthy and cohesive societies and spurs economic growth. It represents a critical stage of the system that not only links initial education to higher education, but also connects the school system to the labour market.

An increasing number of countries aim for universal participation in secondary education. The social returns on investment are greater than in higher education regardless of the income level of the country (Psacharopoulos and Patrinos, 2002).<sup>1</sup> In addition, data from middle-income countries show that wage premiums for secondary school completers can be observed for both women and men. Workers with upper secondary education earn higher salaries than those with a lower level of education (UIS and OECD, 2003).<sup>2</sup> Furthermore, an analysis of OECD countries indicates that persons with upper secondary and post-secondary non-tertiary education are much more likely to be employed than those with less education. Also, across OECD countries, unemployment rates decrease as educational attainment increases (OECD, 2010a). While participation at the secondary level has grown significantly in many countries, equitable access and completion—as well as the quality and relevance of secondary education—represent major challenges.

This edition of the *Global Education Digest* provides an overview of the status of secondary education

<sup>1</sup> Social returns are defined on the basis of private benefits and total (private plus external) costs, because typical social rate of return estimates do not include social benefits.

<sup>2</sup> Based on data from countries participating in the UIS World Education Indicators (WEI) programme: Argentina, Brazil, Chile, Indonesia, Paraguay, Peru, Thailand and Uruguay.

with regard to access, equity, quality and financing. New indicators developed by the UNESCO Institute for Statistics (UIS), which help to inform policy debates, are presented.

The key questions addressed in this chapter include:

- How much has secondary participation grown during the last ten years and how does this compare with changes in primary education?
- To what extent has growth in primary enrolment led to pressure on secondary education?
- Do boys and girls have the same chances of completing secondary school?
- Are there enough secondary teachers to meet rising demand?
- Are governments sufficiently investing in secondary education?

The demand for secondary education is expanding, and views about its role are changing. As more children enter and progress through primary school, the demand for secondary education has been growing. Globally, the end of primary education is no longer the most common exit point from the education system (UIS, 2005b). While almost all countries have made primary education compulsory, many are now moving to make the lower secondary level mandatory as well. Moreover, the demand for secondary education—especially for upper secondary education—has increased with the need for more sophisticated workers with relevant competencies, knowledge and skills, acquired after the primary level of education.

Ensuring equitable access to secondary education is a challenge, particularly in developing countries. While the primary school completion gap between rich and poor countries has been diminishing, it

has widened among these countries for secondary school completion in the past 40 years (World Bank, 2005). Most developed countries are nearing universal secondary education, but the gross enrolment ratio for this level in some developing countries, particularly in sub-Saharan Africa, remains low.

Secondary education is more costly per student than primary education, and few low-income countries provide that level of education for free. Also, distance to school often increases at the secondary level, which is a barrier to entry. Dropouts in secondary education are a growing phenomenon in countries where youth are particularly affected by problems such as school violence, drugs and HIV/AIDS (ADB, 2008). Completion of secondary school remains an important challenge even in some of the world's richest countries.

Greater access to secondary education should be planned while ensuring its quality and relevance. Developing countries are investing more today in secondary education than industrialised countries did when they faced similar levels of income. Rapid expansion is generally perceived as coming at the expense of quality, and it can lead to increased social, gender and ethnic inequality (World Bank, 2005). In countries where there are problems with the quality of secondary schooling and the relevance of the knowledge and skills it promotes, further expansion of secondary enrolment may not be seen as a priority, at least not until employment prospects for secondary school graduates improve and effective reforms have taken place (Lewin and Cailods, 2001).

Resource mobilisation and financial sustainability remain challenges for the provision of quality

secondary education. A number of countries have shifted emphasis towards a longer basic education cycle by including the lower secondary level. In countries that have been unable to deliver affordable, good-quality basic education to large sections of the population, this shift in emphasis raises important questions for equity in public finance (UNESCO, 2010). A recent assessment of financial sustainability focusing on low-income countries in sub-Saharan Africa concludes that the development of post-primary education would require sizable amounts of external aid to fill funding gaps and the cost of service delivery and the potential for resource mobilisation policies would need to be tailored to local contexts (World Bank, 2010a).

Section 1 of this report examines key issues in access and equity in secondary education. The authors trace the evolution of participation and completion rates for secondary education from 1970 to 2009. In addition, household survey data shed light on changes in the educational attainment of individuals before exploring the impact of compounding disparity on the education experiences of out-of-school adolescents, which are shaped by gender, over-age enrolment, income level and geographic location. This section also examines the status of technical and vocational education and training in secondary education.

Section 2 analyses the quality of secondary education by focusing on the resources available for teaching and learning. A wide range of data is presented to evaluate the strength of the global teaching force. The current status of financing secondary education is examined in Section 3, which identifies a modest set of policy options to improve the allocation and efficiency of resources.

# GLOBAL PERSPECTIVE ON STUDENT PROGRESSION IN SECONDARY EDUCATION

## 1.1 BUILDING THE FOUNDATION: PRIMARY EDUCATION

The number of children attending primary school has exploded over the last ten years, thanks in large part to the tremendous resource mobilisation campaigns and political commitments arising from the World Education Forum in 2000 (see **Box 1**). Nevertheless, the bid to achieve universal primary education (UPE) by 2015 is far from certain at the global level. Countries that have managed to expand access to primary education are now faced with greater demand for secondary education. The international community as a whole is therefore increasingly focused on expanding access to both levels of education, while seeking to improve the quality of learning services provided.

In order to better understand the implications of these international commitments, this section provides a global overview of the current situation of primary education based on results from the UIS annual education survey. It presents enrolment and completion rates before exploring the extent to which

pupils make the transition from primary to lower secondary education.

### Global participation in primary education: Evident progress, but many children are still not starting on time

In 2009, 702 million children were enrolled worldwide in primary education, compared to 646 million in 1999. This marked improvement in access to primary education represents an increase of 9% worldwide (see **Table 1**) and was concentrated in specific regions: enrolment increased by 59% in sub-Saharan Africa (66% for girls), 28% in South and West Asia, and 17% in the Arab States. In 2009, more than one-half of the world's children enrolled in primary school were found in two regions: East Asia and the Pacific (27%) and South and West Asia (28%).<sup>3</sup>

Table 1 reflects how demographic change can influence enrolment at the primary level of education.

<sup>3</sup> East Asia and the Pacific and South and West Asia: UIS estimates based on data with limited coverage for the reference year, produced for specific analytical purposes.

### BOX 1. Primary enrolment targets in Education for All (EFA) and the Millennium Development Goals (MDGs)

At the turn of the 21<sup>st</sup> century, the international community reached a consensus and pledged to achieve universal primary education (UPE) and gender parity. In 2000, the Dakar Framework for Action and the United Nations Millennium Declaration reaffirmed the notion of education as a fundamental human right.

#### EFA Goal 2

Ensuring that by 2015 all children, particularly girls, children in difficult circumstances and those belonging to ethnic minorities, have access to, and complete, free and compulsory primary education of good quality (UNESCO, 2000).

#### MDG Goal 2: Achieve universal primary education

To ensure that, by the year 2015, children everywhere, boys and girls alike, will be able to complete a full course of primary schooling (United Nations, 2000).

**TABLE 1. Change in primary school-age populations, enrolment and coverage, 1999 and 2009**

<b>WORLD</b>	<b>-0.3</b>	<b>8.6</b>	<b>84 **</b>	<b>90 **</b>

**Note:** East Asia and the Pacific and South and West Asia: UIS estimates based on data with limited coverage for the reference year, produced for specific analytical purposes.

*Source:* UNESCO Institute for Statistics database and Statistical Table 3.

For example, in Central Asia, the primary school-age population dropped by 20% from 1999 to 2009, and primary enrolment also dropped by 20%. For most regions with expanding primary school-age populations, however, the increase in primary enrolment has outpaced population growth over the decade.

In order to better evaluate effective progress towards the goal of UPE, the UIS developed the adjusted

net enrolment rate (ANER) which measures actual school participation of the official primary school-age population. It reflects the percentage of this population enrolled in primary or secondary education.

A comparison of the 1999 and 2009 ANERs indicates that there has been an increase in primary school enrolment for the target population. Nonetheless, over-age and under-age children still take part in great

**FIGURE 1** What proportion of primary school-age children are enrolled at the appropriate age?  
Adjusted net enrolment rate for primary education by region, 1999 to 2009

**Note:** East Asia and the Pacific and South and West Asia: UIS estimates based on data with limited coverage for the reference year, produced for specific analytical purposes.

*Source:* UNESCO Institute for Statistics database and Statistical Table 3.

proportions in primary education: 17% of the children enrolled globally in primary education are outside the theoretical age boundaries set by their education system. Children who start school late or repeat grades are more likely to drop out and/or repeat again (Lewin and Little, 2011; Wells, 2009).

**Figure 1** illustrates the global trends in ANER from 1999 to 2009. Worldwide, 90% of primary school-age children are enrolled in primary or secondary education. This proportion rises to 95% and above in the following regions: East Asia and the Pacific; Latin America and the Caribbean; and North America and Western Europe. But in the Arab States, only 86% of primary school-age children are enrolled in primary or secondary school, and the figure falls to 77% in sub-Saharan Africa.

Despite these lower values, both regions have made considerable progress since 1999. The ANER increased by 18 percentage points in sub-Saharan Africa, by 9 percentage points in the Arab States and by 12 percentage points in South and West Asia.<sup>4</sup>

These trends reflect the tremendous efforts made to increase the supply and demand for primary education. From a policy and planning perspective, they also highlight the need to better ensure that children start school on time and to provide the additional support needed for over-aged children who are at greater risk of repeating grades and/or dropping out.

### **Completion of primary education: In some regions, girls must still overcome important disparities**

Reaching the goal of UPE would be a hollow achievement if it focused simply on enrolment rather than completion of primary education. At the global level, the UIS estimates that in 2009 primary completion rates (as measured by the gross intake rate to the last grade of primary education) were as

high as 88%, although regional values ranged from 67% in sub-Saharan Africa to 101% in Latin America and the Caribbean.

The gross intake ratio (GIR) to the last grade of primary education is a proxy measure of completion, as it gives an internationally comparable picture of the capacity of education systems to enable children to complete a full cycle of primary education. It also reflects the cumulative impact of policies shaping the earlier grades of primary school.

More specifically, the indicator expresses the total number of new entrants to the last grade of primary education (regardless of their age) as a percentage of the population of the theoretical entrance age to the last grade of primary.

**Figure 2** provides a gender perspective on entrance to the last grade of primary education in 162 countries from different regions. The horizontal axis plots the gross intake ratio to the last grade of primary, while the vertical axis indicates the position of a country with regard to the adjusted gender parity index (adjusted GPI) (see **Box 2**).

In general, three-quarters of the 162 countries with data show a GIR to the last grade of primary education of 80% or above. In 32 of these countries, including Argentina, Germany, Grenada, Kazakhstan, the Syrian Arab Republic and the United Republic of Tanzania, it is notable that the ratios exceed 100%, reflecting the presence of over-age (and possibly some under-age) children in the system (see *Statistical Table 4*).

Girls and boys have equal chances of graduating from primary education in 91 countries (56% of the 162 countries presented), which have GPIs ranging from 0.97 to 1.03. However, significant disparities persist within countries across all of the regions (see *Figure 2*). While there are countries where girls are more likely to complete primary education than boys, the majority of cases with a gender imbalance are against girls.

<sup>4</sup> South and West Asia: UIS estimate based on data with limited coverage for the reference year, produced for specific analytical purposes.

In 47 countries, girls are less likely than boys to enter the last grade of primary education. The most extreme situations are found in the Central African Republic, Chad, the Democratic Republic of the Congo and Yemen, where between 57 and 69 girls enter that grade for every 100 boys. Nearly one-half of the countries where girls are less likely to complete primary education than boys are in sub-Saharan Africa, although girls also face serious barriers in Iraq (adjusted GPI of 0.74) and Sudan (0.88) in the Arab

States and the Maldives (0.88) and Pakistan (0.79) in South and West Asia.

At the opposite end of the spectrum, boys are less likely to complete primary education than girls in 24 countries. The most acute challenges are found in Lesotho, Nicaragua and Suriname, where the adjusted GPI is 1.10 or higher. The adjusted GPI also shows high values for the GIR in Namibia (1.09), Bangladesh (1.08) and Bhutan (1.08).

**FIGURE 2** Do boys and girls have equal chances of completing primary education? Gross intake ratio to the last grade of primary education and adjusted gender parity index, 2009

Source: UNESCO Institute for Statistics, Statistical Table 4.

**BOX 2. Understanding the gender parity index (GPI)**

The GPI is a measure used to assess gender differences in education indicators. It is defined as the value of a given indicator for girls divided by that for boys. A GPI value of 1 signifies that there is no difference in the indicators for girls and boys—they are perfectly equal. UNESCO (2003) has defined a GPI value of between 0.97 and 1.03 (after rounding) as the achievement of gender parity. This allows for some measurement error but does not imply a judgement about the acceptability of any particular level of disparity.

In cases where disparities are apparent, the interpretation of the GPI depends on the type of indicator. A GPI of less than 1 indicates that the value of the indicator is higher for boys than for girls, and the opposite is true when the GPI is greater than 1.

For indicators where higher values are desirable (e.g. school participation rates), a GPI of less than 1 means that girls are at a disadvantage, while a GPI greater than 1 means that boys are at a disadvantage. For indicators where lower values are desirable (e.g. dropout rates), a GPI of less than 1 means that boys are at a disadvantage, and a GPI of greater than 1 means that girls are at a disadvantage.

One of the difficulties in presenting the GPI is that the scale of disadvantage for girls or boys is not represented symmetrically around 1. For example, a GPI of 0.5 indicates that the female value of the indicator being reviewed is one-half the male value, while a GPI of 1.5 (also 0.5 units away from parity) indicates that the male value of the indicator is two-thirds of the female value (not one-half). Consequently, when boys are under-represented in a given indicator, it appears more drastic than when girls are disadvantaged.

Thus, for the analysis and figures presented in this section, the GPI is adjusted to present disadvantages symmetrically for both genders. The adjusted GPI is derived from the standard GPI as presented in the Statistical Tables, but values greater than 1 are treated differently in this section and disparities are presented on a comparable scale.

The adjusted GPI uses the following methodology: when the ratio of female to male values of a given indicator is less than 1, the adjusted GPI is identical to the unadjusted GPI. By contrast, when the ratio is greater than 1, the adjusted GPI is calculated as the ratio of male to female values and the ratio is subtracted from 2. For instance, if the net enrolment rate (NER) for males is 33% and 66% for females, the ratio of male to female NER is 0.5. Then, subtracting 0.5 from 2 gives an adjusted GPI of 1.5, while the unadjusted GPI would show a result of 2.

**Note:** Only the regular (not adjusted) GPI is presented in the Statistical Tables of this report.

### The transition from primary to lower secondary education: A new UIS indicator explores potential barriers

Currently lower secondary education is compulsory in approximately 80% of countries in the world, and the transition to secondary education needs to be ensured in those countries. Furthermore, higher levels of skills are demanded by the labour market. Greater priority should, thus, be given to the transition from primary to lower secondary education.

The UIS has developed the effective transition rate (see **Box 3**) to better reflect the real transition rate of pupils from primary to lower secondary education. This indicator can be used to inform policies aimed

at reconciling imbalances between the supply of and demand for education.

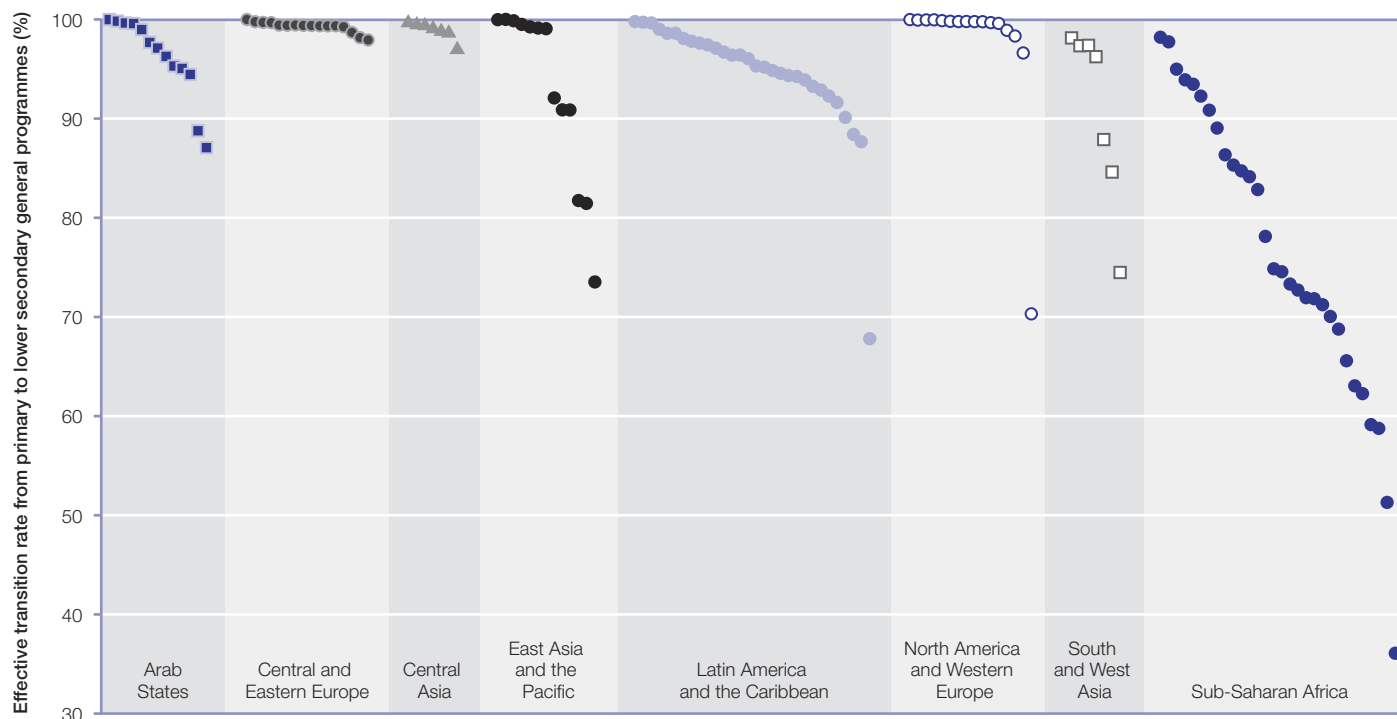

As illustrated in **Figure 3**, transition rates are 95% and above in most countries in the following three regions: Central and Eastern Europe; Central Asia; and North America and Western Europe. The notable exception is Israel, with a transition rate of 70%.

Rates are also relatively high in the Arab States, with country values ranging from 100% in Jordan to 87% in Morocco. A similar trend is found in Latin America and the Caribbean, where most of the 30 countries with available data have transition rates ranging from 88% (Grenada and Uruguay) to 100% (Argentina and the Bahamas), with the exception of Suriname at 68%.

FIGURE 3

## To what extent do pupils make the transition to lower secondary education?

Transition rate from primary to lower secondary education by region, 2008 to 2009

**Note:** Number of countries covered by region: Arab States (13/20), Central and Eastern Europe (16/21), Central Asia (7/9), East Asia and the Pacific (13/34), Latin America and the Caribbean (30/42), North America and Western Europe (16/29), South and West Asia (7/9) and sub-Saharan Africa (30/45).

*Source:* UNESCO Institute for Statistics, Statistical Table 7.

**BOX 3. The effective transition rate**

The UIS developed a new indicator, the effective transition rate, to show the likelihood of a student moving to a higher level of education. It reflects the estimated transition of students from one education level to the next regardless of repetition. Other indicators can underestimate the transition rate from primary to lower secondary education because the denominator includes pupils who repeat the final grade in primary education (i.e. those who neither leave primary education nor advance to secondary education).

For secondary education, the effective transition rate in a given year ( $t$ ) is based on the following calculation method: the number of new entrants to the first grade of lower secondary education for the following year ( $t + 1$ ) is divided by enrolment in the last grade of primary education (in the given year ( $t$ )) minus the number of repeaters from the last grade of primary education in the following year ( $t + 1$ ), and the result is multiplied by 100.

This indicator can help assess the potential barriers in an education system. These barriers can be related to different factors, such as cost barriers (e.g. enrolment fees, expenses to purchase textbooks or school uniforms, etc.) or supply issues (e.g. limited number of teachers or classrooms).

In general, a low effective transition rate is linked to two key factors: i) a high dropout rate from the last grade of primary education; and ii) limited access to lower secondary education. The new indicator better reflects situations where pupils repeat the last grade of primary education but eventually make the transition to lower secondary education.

The gap between countries widens in East Asia and the Pacific. In the Republic of Korea, all pupils make the transition from primary to lower secondary education, while this is the case for fewer than three out of four pupils (74%) in Myanmar. A similar trend is found in South and West Asia, with Bhutan reaching a transition rate of 98% while Pakistan stands at 75%.

Sub-Saharan Africa is the region with the greatest variation among the 30 countries with available data. The effective transition rate is 98% in the Seychelles, yet in the United Republic of Tanzania only 36% of primary school pupils make the transition to lower secondary education. In 27 countries, including Ethiopia, South Africa and Uganda, the transition rate varies between 51% and 95%.

Low transition rates indicate a bottleneck in the education system. As previously explained, the number of children enrolled in primary education and reaching the last grade of the cycle has been dramatically increasing in all regions, including sub-Saharan Africa. Yet in many countries, the majority of these children are unable to pursue lower secondary education. There are many potential reasons for this bottleneck, including the direct and indirect costs of education (i.e. tuition fees, school uniforms, and time away from household chores or external employment). In addition, many countries are simply unable to meet the growing demand for education. Overall, school progression and educational choices are closely linked to the labour market and its opportunities, as well as other incentives. These issues will be further explored in the following discussions on participation and completion in lower and upper secondary education, including the opportunities available through technical and vocational education and training.

## 1.2 PARTICIPATION IN SECONDARY EDUCATION SINCE 1970

The demand for secondary education continues to grow significantly. This section tracks secondary enrolment trends at the global and regional levels since 1970. Because existing data prior to 1990

make no distinction between lower and upper secondary levels, the focus here is on enrolment and participation in secondary education as a whole, combining both levels into a single educational cycle (for more information on the classification of secondary programmes, see **Box 4**).

### Changes in global population and enrolment patterns: Demand still outstrips supply

Governments have made significant progress in expanding the capacity of secondary education systems in their countries. As a result, they were able to accommodate 531 million students in 2009, compared to 196 million in 1970. Since 1970, the world has witnessed substantive growth in secondary enrolment as illustrated in **Figure 4**. In addition, the share of girls in total secondary enrolment grew from 43% to 48% during this period.

Much of this growth took place in regions which started with low rates of participation in secondary education. For example, the regions of North America

#### BOX 4. Classifying lower and upper secondary education

According to the International Standard Classification of Education (ISCED), secondary education is divided into two different levels: lower secondary education (ISCED 2) and upper secondary education (ISCED 3).

The content of education programmes at ISCED 2 level is typically designed to complete the provision of basic education. In most countries, the aim is to lay the foundation for lifelong learning and human development on which further educational opportunities can be systematically expanded. Lower secondary education often forms part of compulsory education.

Programmes at the upper secondary level (ISCED 3) are typically designed to complete secondary education in preparation for tertiary education. The components for developing skills relevant to employment are included in both ISCED 2 and ISCED 3 levels.

and Western Europe and East Asia and the Pacific had similar levels of enrolment in 1970, between 53-54 million secondary students. By 2009, East Asia and the Pacific (163 million) had 100 million more secondary students compared to North America and Western Europe (62 million).

Enrolment data provide a good indicator of the provision of secondary education. However, to what extent does this provision correspond to the size of the relevant school-age population? **Figure 5** shows that secondary school enrolment grew at a faster rate than the school-age population between 1970 and 2009. Enrolment worldwide increased by an average annual rate of 2.6%, while the targeted school-age population grew by 1.4%.

The gross enrolment ratio (GER) provides a measure of the capacity of education systems. It is the ratio of total enrolment, irrespective of age, to the targeted population. A GER equal to or exceeding 100% indicates that the national system can accommodate all its school-age population at a given education level. Lower values can reflect a shortage of supply, as well as the impact of other factors, such as the indirect and direct costs of attending school, which may limit enrolment.

Globally, the secondary GER rose from 43% to 68% between 1970 and 2009. This means that enrolment in secondary schools represents 68% of the targeted school-age population. However, the situation varies considerably across and within regions.

In the Arab States, secondary school enrolment increased from 4 million to almost 30 million students between 1970 and 2009. The region also witnessed a remarkable rise in its participation ratio, with the GER increasing from 22% to 68% over the same period. Girls continue to face some barriers in terms of access to secondary education, yet real progress has been made with the female GER rising from 14% to 65% since 1970.

In absolute terms, the largest gains in enrolment were observed in Egypt, Algeria and the Syrian Arab Republic, where the number of secondary students grew by 5.2, 4.3 and 2.3 million, respectively. Other countries, such as Iraq, Morocco, Sudan and Tunisia, were each able to add more than 1 million pupils to their secondary schools during the same period.

Total enrolment in secondary education in Central and Eastern Europe decreased from 37 million in 1970 to 31 million in 2009, following the downward trend of

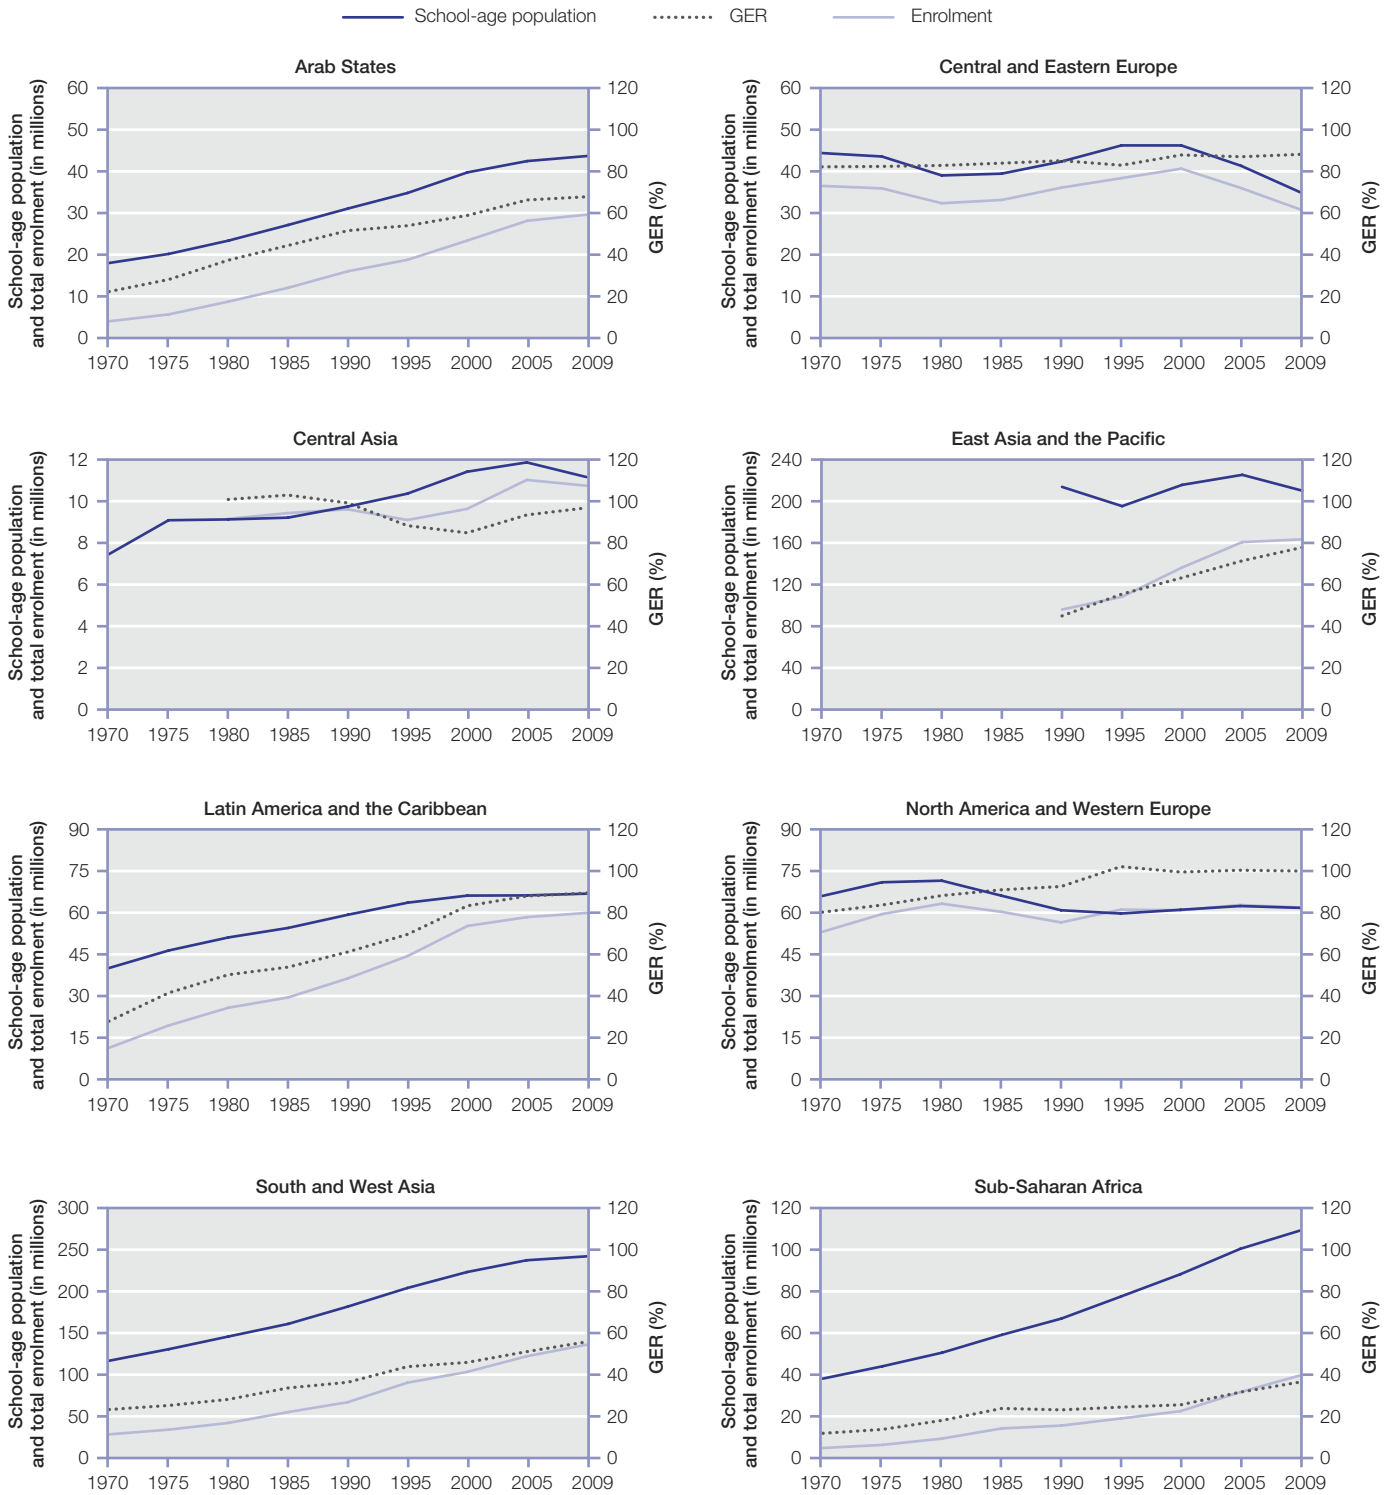

**FIGURE 4** To what extent has secondary enrolment increased over time?  
Enrolment in secondary education by region

**Note:** Note that the scale for the y-axis may differ across regions.  
**Source:** UNESCO Institute for Statistics database.

the school-age population which declined from 44 million to 35 million during the same period. This led to a rise in the GER, from 82% in 1970 to 88% in 2009. Since 1970, this region has achieved and maintained equal access to secondary education for both boys and girls.

Available statistics show that Turkey was the only country in this region that had positive growth in secondary enrolment from 1971 to 2008. The country was able to stretch its education system to accommodate 6.7 million secondary students in 2008 in comparison to 1.3 million in 1971. However, most of the other countries in the region experienced a decrease in secondary enrolment with the decline in the school-age population.

Historical data for Central Asia begin in 1980. Since then, secondary enrolment grew from 9 million to 11 million, with the GER at 96% in 2009. Gender parity has been a reality in the region throughout this period. Based on available statistics, Uzbekistan witnessed the biggest expansion in absolute secondary enrolment, which increased from 2.9 million to 4.5 million during the period 1980-2009. Enrolment in most of the countries in this region either stagnated or declined because of falling population rates.

For East Asia and the Pacific, the analysis is limited to the period 1990-2009 due to concerns about the comparability of historical time series data. During this period, enrolment in secondary education increased from 96 million to 163 million. On the other hand, the school-age population for the region—heavily influenced by the population trend of China—totaled 210 million in 2009, slightly less than the 214 million recorded in 1990. The GER rose from 45% in 1990 to 78% in 2009 across East Asia and the Pacific. In addition, the participation of young women grew significantly during this time, with the secondary GER reaching 80% compared to 76% for young men.

At the national level, China—the most populated country in this region—doubled its education system's capacity over this period. It was able to accommodate 100 million secondary students in

2009, compared to 52 million in 1991. Indonesia and Viet Nam also increased secondary enrolment by 9 million and 6 million, respectively.

In Latin America and the Caribbean, enrolment in secondary education increased from 11 million to 60 million from 1970 to 2009. Secondary school enrolment has grown faster than the corresponding school-age population. The gap between these two has narrowed, from 29 million in 1970 to less than 7 million in 2009. As a result, the GER grew from 28% to 90%.

Historically, gender parity in secondary education has been common for most countries in Latin America and the Caribbean. Nevertheless, since the mid-1980s, girls have greater access to secondary education than boys. In 2009, the secondary GER for girls (93%) exceeded that of boys (86%).

At the national level, Brazil witnessed the biggest expansion of secondary education in absolute terms since 1970. In 2009, this country alone accommodated 23.6 million students, compared to 4.6 million in 1971. A similar expansion took place in Mexico, where the number of secondary students grew from 1.6 million in 1971 to 11.5 million in 2009.

During the period 1970-2009, enrolment growth in secondary education was modest in North America and Western Europe. This is not surprising, given the combination of historically high participation in secondary education and the declining school-age population in this region. Total enrolment at the secondary level increased from 53 million to 62 million. On the other hand, the school-age population declined from 66 million to 62 million during the same time. As a result, the GER grew from 80% in 1970 to 100% in 2009, the highest participation rate among all regions. Since 1970, the region has maintained gender parity in secondary education.

In South and West Asia, total enrolment at the secondary level increased from 26 million in 1970 to 136 million in 2009. This expansion exceeds growth of the school-age population, which more

than doubled, from 116 million to 244 million, over the same period. As a result, the GER rose from 23% to 56%. The gender gap, in terms of access to secondary education, remains evident in this region where the GER for girls was 52% compared to 59% for boys in 2009. But this fact should not conceal the progress realized since 1970, when the participation of girls in secondary education was less than one-half that of boys (13% compared to 31%).

The most populated country in the region, India, accounts for three-quarters of the regional leap in enrolment. From 1970 to 2009, enrolment in secondary education increased from 21 million to 102 million in this country alone. Many other countries in the region also expanded the capacity of their education systems. For example, there was strong growth in enrolment at the secondary level in the Islamic Republic of Iran (from 1 million to 8 million), Pakistan (from 1.4 million to 9 million) and Bangladesh (from 2 million to 10 million).

Since 1970, total enrolment in secondary education grew nine-fold in sub-Saharan Africa, expanding from 4.3 million to 39 million. This spectacular result must be considered in relation to the growth of the

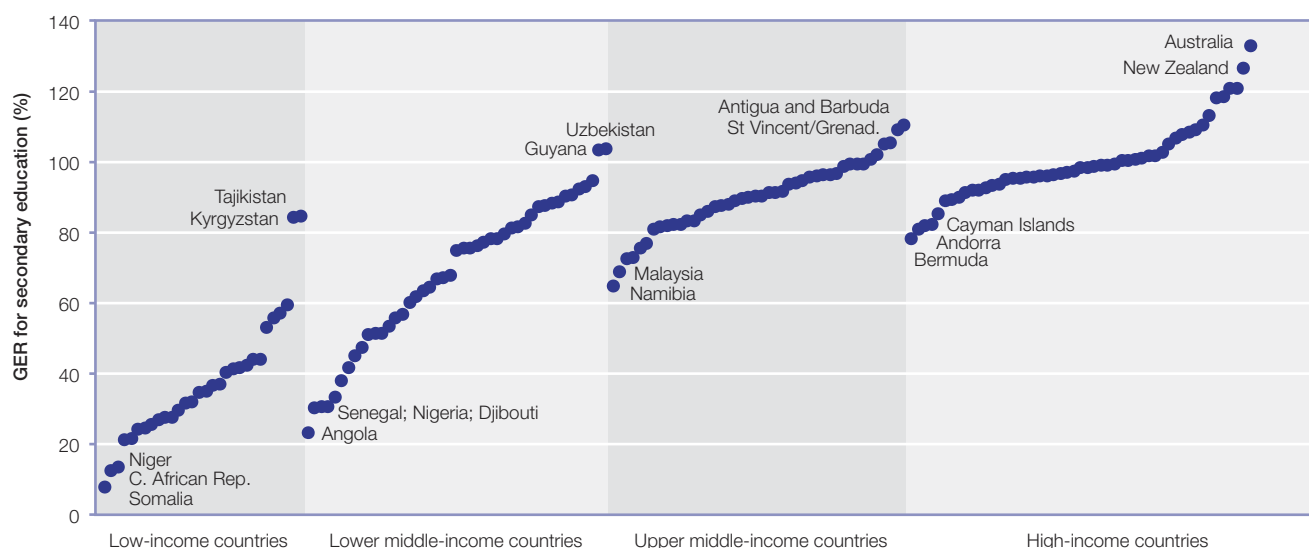

secondary school-age population, which tripled over the same period. As a result, the GER rose from 11% to 36% between 1970 and 2009.

Despite this progress, the region still has the lowest rate of participation in secondary education and the most severe gender disparities. In 2009, the GER for boys exceeded that of girls by 9 percentage point (41% versus 32%). Nevertheless, many countries in this region have significantly expanded their secondary education systems. In absolute values, the biggest increase took place in Nigeria, where the number of students enrolled in secondary education grew from just 400,000 in 1970 to more than 6 million in 2007. In Ethiopia, enrolment grew from 135,000 to 3.9 million students between 1971 and 2009. Secondary education systems also expanded significantly in Burkina Faso, Burundi, Chad, the Democratic Republic of the Congo, Kenya, Niger and the United Republic of Tanzania.

### Participation ratios and national wealth

As illustrated in **Figure 6**, there is a strong link between secondary participation ratios and national wealth. As a group, low-income countries had the

**FIGURE 6** To what extent is participation in secondary education associated with national wealth? Gross enrolment ratios for secondary education by national wealth, 2009

**Note:** The classification of countries by income level is based on the World Bank Atlas Method, revision of July 2011.  
**Source:** UNESCO Institute for Statistics, Statistical Table 6.

lowest participation ratio at 39% in 2009, compared to 64% for lower middle-income countries and 90% for upper middle-income countries. Among high-income countries, the average GER reached 100%.

By grouping countries according to their income level, it is possible to identify general trends. However, exceptions to these patterns are clearly seen at the country level. Among low-income countries, participation ratios are even lower than the group average in Somalia (8%), Central African Republic (12%) and Niger (13%). In contrast, Kyrgyzstan and Tajikistan exceed the average for this group, with 80% of their relevant school-age populations participating in secondary education.

Several upper middle-income countries report levels exceeding 100%, which is typically found in the high-income group. These countries include: Antigua and Barbuda, Brazil, Dominica, Montenegro, Saint Vincent and the Grenadines, and Seychelles. Finally, it should be noted that five high-income countries/territories (Andorra; Bermuda; Cayman Islands; China, Hong Kong Special Administrative Region; and Qatar) had GERs below 85% compared to the high-income group average of 100%.

### 1.3 PARTICIPATION TRENDS IN LOWER SECONDARY EDUCATION

The previous discussion focused on secondary education, with lower and upper secondary being treated as a single category for cross-national comparisons. However, in some countries lower secondary is the second and final phase of basic education. In these cases, primary and lower secondary levels are often combined in the same schools and taught by the same teachers. In other countries, lower secondary is clearly distinct from primary education, with pupils sharing the same schools with upper secondary students. These are important differences and, thus, good reasons for looking at lower and upper secondary education separately (UIS, 2005b).

### Rising enrolment for girls but challenges remain

**Figure 7** presents changes in lower secondary GERs between 1999 and 2009 by region. Globally, the GER for lower secondary education increased from 72% to 80% during this period. There was widespread expansion of this education level in all regions of the world. From 1999 to 2009, the most notable increases occurred in sub-Saharan Africa, where the GER for lower secondary education rose from 28% to 43%, and in the Arab States, where it rose from 72% to 87%.

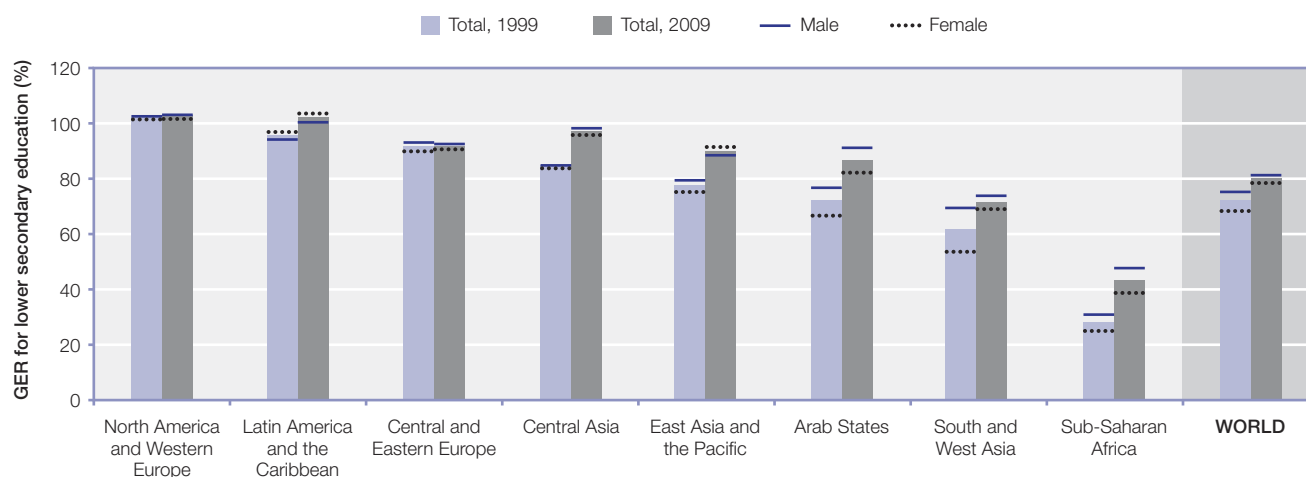

In Latin America and the Caribbean and in North America and Western Europe, the GERs for this education level are above 100% (reflecting over-age students). Education systems in Central and Eastern Europe, Central Asia, and East Asia and the Pacific also have the capacity to achieve universal participation in lower secondary education with ratios equal to or exceeding 90%.

Globally, girls' participation in lower secondary education has been steadily increasing since 1999, from a GER of 69% to 79% in 2009. The most substantial increases in female participation were observed in East Asia and the Pacific, from 75% to 91%, and in South and West Asia, from 53% to 69%. During the same period, girls' enrolment rates in the Arab States rose from 67% to 82% and from 25% to 39% in sub-Saharan Africa. However, gender disparities persisted in 2009: the GER for boys was 9 percentage points higher in both regions.

In contrast, girls' participation in Latin America and the Caribbean has been higher than that of boys since 1999. The GER for girls in that region rose from 97% in 1999 to 104% in 2009, while for boys it increased from 94% to 100% over the same period (see *Statistical Table 6*).

### Compulsory education at the lower secondary level: The gap between laws and reality

National efforts to guarantee UPE have increased the demand for lower secondary schooling. In many

**FIGURE 7**
**How do participation ratios differ by sex and by region since 1999?**
**Gross enrolment ratios for lower secondary education by gender and by region, 1999 and 2009**

Source: UNESCO Institute for Statistics database and Statistical Table 6.

cases, this has led to legislative action to expand the definition of compulsory education to include lower secondary education. In many countries, the right to lower secondary education has been guaranteed by measures such as compulsory education laws.

**Figure 8** shows that four out of five children worldwide live in countries where lower secondary schooling is compulsory, but one-half of those four children live in countries that do not have universal enrolment in lower secondary education. While legal frameworks are often in place, participation in lower secondary education is far from universal. One-third of the world's children live in countries where the lower secondary level is formally considered compulsory but where GERs for this level are below 90%.

In five regions (Central and Eastern Europe, Central Asia, East Asia and the Pacific, Latin America and the Caribbean, and North America and Western Europe), 88% or more of the children live in countries where participation in lower secondary education is compulsory. However, in Latin America and the Caribbean, as well as in East Asia and the Pacific, some countries have low participation levels. For example, although it is compulsory, the GER for lower secondary education was 62% in

Guatemala and 53% in Lao People's Democratic Republic in 2008.

In Central and Eastern Europe, almost all children live in countries where lower secondary schooling is compulsory. However, two out of five children live in countries where enrolment ratios are below 90%, as in the case of Bulgaria, the Republic of Moldova and the Russian Federation.

Compulsory lower secondary education is less common in the Arab States, South and West Asia and sub-Saharan Africa. In South and West Asia, although lower secondary is compulsory for a majority of children, only 1% lives in countries with enrolment ratios above 90%. For example, in Afghanistan and India lower secondary enrolment ratios are below 80%.

Twenty-two countries in sub-Saharan Africa have compulsory lower secondary education, but 17 of them are not meeting the target of universal participation at this level. For example, in Angola, Burkina Faso, the Central African Republic and Nigeria, the enrolment ratios for lower secondary education are between 17% and 34%.

FIGURE 8

### To what extent are children enrolled in secondary education in countries where it is compulsory?

**Note:** Countries with compulsory lower secondary education weighted by lower secondary school-age population. This figure covers 189 countries and territories representing 99% of the world population.

*Source:* UNESCO Institute for Statistics, Statistical Tables 5 and 6.

#### Lower secondary education completion: Gap widens between sub-Saharan Africa and other regions

More students have access to lower secondary education, but how many of them are actually completing this level? The following analysis is based on data from 80 countries and territories—about two out of five countries reporting education statistics to the UIS. However, data are not available for high-income countries, such as Australia, Canada, France, Germany and the United States (see *Statistical Table 7*).

The gross graduation ratio is generally used as a proxy to measure completion at the lower secondary

level. This ratio compares the number of graduates of lower secondary education to the population of graduation age for this level. **Figure 9** presents gross graduation ratios for the ISCED 2 level for the 80 countries reporting data.

In Central and Eastern Europe, gross graduation ratios for lower secondary education exceed 80% in the five reporting countries. The same can be noted in Central Asia, for eight of the nine countries with data available. Completion also seems to be the norm in Latin America and the Caribbean, where about one-half of the 28 countries with available data have reported graduation ratios above 80%. Exceptions are Guatemala, Guyana and Honduras, where the ratios are 40% or below.

**FIGURE 9**

**What proportion of students complete lower secondary education?  
Gross graduation ratio for lower secondary education, all programmes, 2009**

**Notes:** <sup>1</sup>Data refer to 2008; <sup>2</sup>Data refer to 2007; <sup>+</sup>Data refer to 2010. Data on graduates at the lower secondary level are not collected in the UNESCO/OECD/Eurostat (UOE) data collection. Therefore, no data are presented for North America and Western Europe and some countries in Central and Eastern Europe.

Source: UNESCO Institute for Statistics, Statistical Table 7.

In the Arab States and East Asia and the Pacific, one-half of countries with available data have lower secondary education graduation ratios exceeding 70%. Nonetheless, low graduation ratios are observed in Cambodia, Djibouti, Lao People's Democratic Republic and Sudan, with ratios below 40%. In South and West Asia, ratios are also low for Bangladesh (45%) and Pakistan (35%). The highest ratio in that region is observed in the Islamic Republic of Iran (81%).

With increasing graduation ratios for lower secondary education in most regions, the gap between sub-Saharan Africa and much of the rest of the world is widening. Graduation ratios are below 70% in 16 out of 17 countries with available data in sub-Saharan Africa, and three-quarters of them are below 40%. In this region, boys are more likely to graduate than girls in 13 of the 15 countries reporting data by gender.

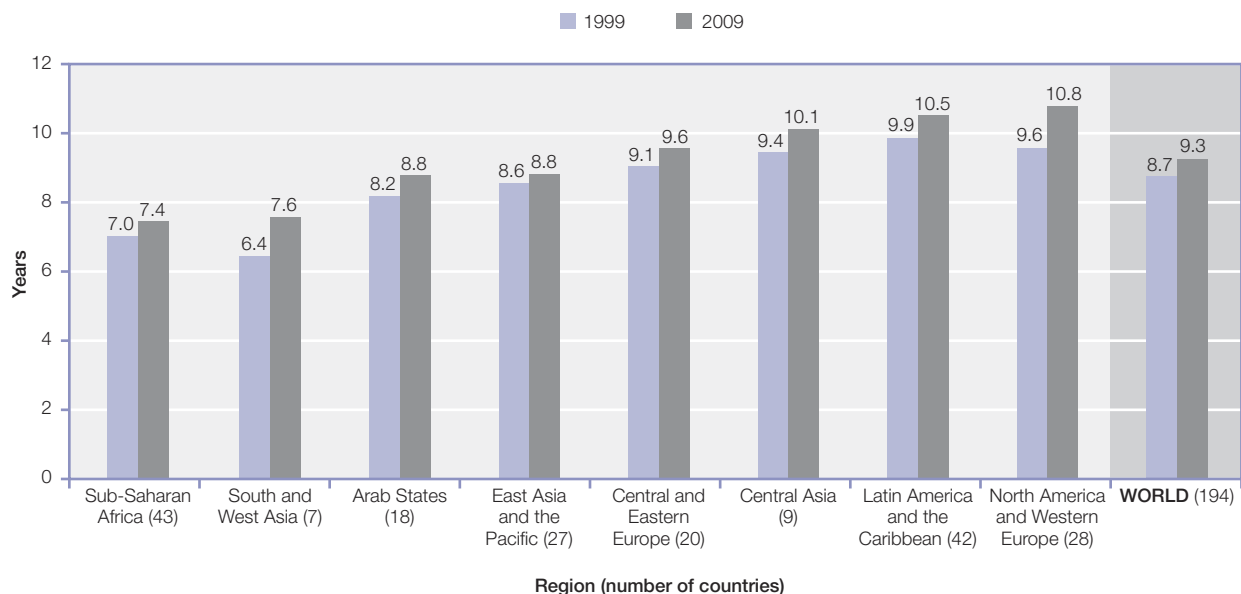

**BOX 5. How do countries define compulsory education?**

How long are children supposed to stay in school? Article 28 of the Convention on the Rights of the Child (United Nations, 1989) includes the commitment to “make primary education compulsory and available free to all”. Article 26 of the Universal Declaration on Human Rights (United Nations, 1948) states that “elementary education shall be compulsory”. By signing international agreements such as these, governments promise to take legal measures to ensure the right to education in their countries—not only to primary education but increasingly to basic education (a notion that includes lower secondary education) and beyond. However, compulsory schooling is still not universally legislated or fully realized in terms of accessibility and availability (i.e. insufficient resources, such as schools and teachers) or completion of specified years of schooling.

The global average duration of compulsory education was 9.3 years in 2009, a slight increase from 8.7 years in 1999 (see **Figure 10**).<sup>5</sup> The longest average duration of compulsory education was noted in North America and Western Europe and in Latin America and the Caribbean for both periods (9.6 and 9.9 years in 1999 and 10.8 and 10.5 years in the most recent year, respectively). The shortest average duration of compulsory education was observed in sub-Saharan Africa and in South and West Asia over the past decade (7.0 and 6.4 years in 1999 and 7.4 and 7.6 years in 2009, respectively).

**FIGURE 10**

**How has the duration of compulsory schooling changed since 1999?**  
Average duration of compulsory education by region, 1999 and 2009

**Note:** Averages in this figure have been calculated based on the number of countries (not weighted) for which data are available.

**Source:** UNESCO Institute for Statistics database, UNESCO (2011), UIS (2011a) and UNESCO-IBE (2006/07, 2010/11).

Primary education (ISCED 1) is now considered compulsory in almost all countries. However, universal primary education is still a far-reaching goal, as 67 million children were still out of school in 2009 (UNESCO, 2011; also see Section 1.6 on out-of-school children). Some countries are making efforts to increase primary school enrolment rates by making pre-primary education (ISCED 0) compulsory (i.e. 28.6% of countries in Latin America and the Caribbean), under the assumption that children with pre-primary education are more likely to enter and complete primary education (UNESCO, 2006).

Many countries are making upper secondary education compulsory. In 2009, lower secondary education (ISCED 2) was a part of compulsory education in 80.4% of all countries with data, and laws on compulsory education now include upper secondary education (ISCED 3) in 21.6% of countries worldwide.

More efforts are needed to better monitor the implementation of compulsory education worldwide. While there appears to be increasing political will to ensure access to more years of education, questions remain concerning how and to what extent these commitments are met around the world.

<sup>5</sup> This analysis is based on an ongoing study carried out by the UIS in collaboration with the UNESCO International Bureau of Education (IBE). The study involves extensive research and cross-checking of UNESCO data from various official sources on compulsory education for the years 1999 and 2009 (UNESCO Institute for Statistics database, UNESCO, 2011; UIS, 2011a; and UNESCO-IBE, 2006/07, 2010/11).

The opposite situation is observed in Latin America and the Caribbean, where girls have higher graduation ratios than boys in 25 out of 28 countries with available data. The exceptions in this region are Anguilla and Guyana, where male students outperform female students in completing their lower secondary studies.

In the Arab States, a gender gap to the disadvantage of boys is observed in graduation ratios at the lower secondary level. In three-quarters of the countries with available data, boys are no match for girls when completing lower secondary education. In that region, girls have higher graduation ratios than boys except in Djibouti and Oman.

In Central Asia, the gender balance can tip either way, depending on the country. One-half of the eight countries reporting data have graduation ratios for the lower secondary level that are higher for female students (Armenia, Kazakhstan, Kyrgyzstan and Mongolia), one-quarter have ratios higher for male students (Georgia and Tajikistan), and the last quarter have equal ratios for both sexes (Azerbaijan and Uzbekistan). In the neighbouring region of Central and Eastern Europe, lower secondary school graduation ratios are higher for female students than male students in three of the four countries (Albania, the Republic of Moldova and Serbia) with available data.

In East Asia and the Pacific, the overall picture shows that girls complete lower secondary education at a higher ratio than boys in most countries with available data. The reverse is observed in Brunei Darussalam, Lao People's Democratic Republic and Indonesia.

#### **1.4 PARTICIPATION AND COMPLETION OF UPPER SECONDARY EDUCATION**

Programmes at the upper secondary level are typically designed to prepare students for higher education and/or to provide skills relevant to employment. This section examines trends over time in participation and completion rates for upper secondary education.

#### **Changing regional patterns in participation since 1999**

In most countries, upper secondary education is not compulsory, which partly explains why young people are less likely to pursue this level of study compared to lower secondary education. As illustrated in **Figure 11**, North America and Western Europe is the only region to have similar GERs for lower and upper secondary education, 103% and 98% respectively, between 1999 and 2009. In most countries in this region, some or all upper secondary education programmes are considered compulsory.

Globally, participation in upper secondary education is on the increase. In 2009, enrolment at this level of education represented 56% of the relevant age group compared to 45% in 1999.

The greatest progress in upper secondary GER was made in East Asia and the Pacific, where the regional GER rose from 45% to 66% between 1999 and 2009, followed by Latin America and the Caribbean (62% to 75%). Central Asia also made significant progress, with the GER at this level increasing from 82% to 94% during this period.

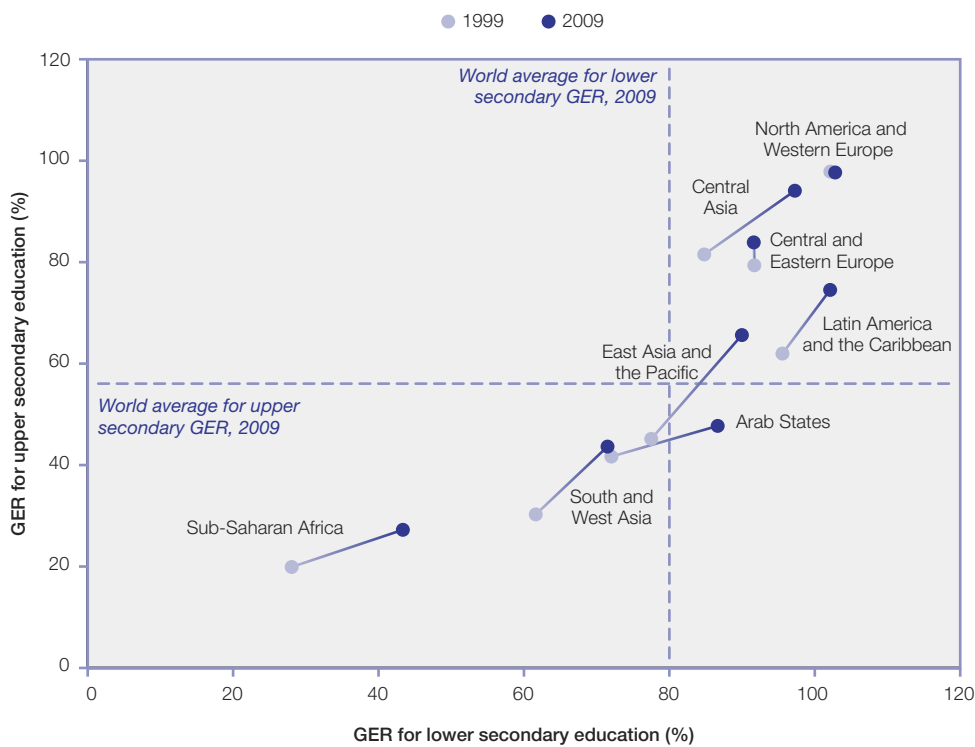

Participation levels remain relatively low in the Arab States and in South and West Asia. In the Arab States, the upper secondary GER rose by just 6 percentage points, from 42% in 1999 to 48% in 2009. This may partly reflect the greater priority placed on improving access to lower secondary education in many countries across the region. In South and West Asia, enrolment at upper secondary education represents only 44% of the targeted school-age population, which nevertheless marks a major improvement compared to 1999, when the ratio was 30%.

Sub-Saharan Africa has the lowest regional GER for upper secondary education: 27% in 2009 compared to 20% in 1999. Moreover, this regional average is to some extent skewed by the weight of a few countries, such as South Africa where the GER reached 93%, Kenya (43%) and the Democratic

FIGURE 11

### How has the gap between lower and upper secondary participation rates changed between 1999 and 2009?

Gross enrolment ratios for lower and upper secondary education by region, 1999 and 2009

Source: UNESCO Institute for Statistics database and Statistical Table 6.

Republic of the Congo (31%). Beyond these exceptions, almost two-thirds of the countries in the region have upper secondary school GERs below the regional average. For example, in the Central African Republic, Niger, Somalia and the United Republic of Tanzania, GERs in upper secondary education programmes were at or below 6% in 2009. However, between 1999 and 2009, lower secondary education GERs have increased significantly in sub-Saharan Africa (from 28% to 43%), implying growing potential demand for upper secondary education.

#### Gender disparities in access to upper secondary education: Tend to decrease and sometimes favour girls

Globally, the participation of young women in upper secondary education has increased, with the female GER at this level rising from 43% to 55% between 1999 and 2009 (see *Figure 12*). The most substantial increases in female participation during

this period were noted in East Asia and the Pacific, from 44% to 68%, and in South and West Asia (see discussion below). Also noteworthy were the increases in female enrolment in upper secondary education in Central Asia (79% to 93%) and Latin America and the Caribbean (66% to 80%) during the same period.

Yet, minor to moderate gender disparities persist in all regions, except for Central Asia and North America and Western Europe, which offer equal access to both gender groups. Central and Eastern Europe has made minor progress in reducing disparities between male and female access to upper secondary education: the GER for young women rose from 77% in 1999 to 81% in 2009, while the GER for young men rose from 82% to 86% during the same period.

Women continue to face significant barriers to upper secondary education in South and West Asia, where the GER for male adolescents was 47% while that for

females was 40% in 2009. Nevertheless, progress has been made towards reducing the gender gap, with the female GER for upper secondary education rising from 25% to 40% between 1999 and 2009.

In sub-Saharan Africa, however, access to upper secondary education is even more difficult for young women, and the gender gap is getting wider at this level. In countries with limited access to education, more priority is given to men. Between 1999 and 2009, the male GER increased from 22% to 31%, while the increase of the female GER was more modest (from 18% to 24%).

In contrast, young men are less likely than young women to participate in upper secondary education in two regions. In Latin America and the Caribbean, the gender gap has actually widened over the past decade. In 1999, young women were already more likely to pursue this level of education than their male counterparts, with the female GER at 66% compared to 58% for young men. By 2009, the disparity intensified, with the female GER reaching 80% compared to 69% for males. The situation is different in East Asia and the Pacific, where young women used to be at a disadvantage in terms of upper secondary school enrolment. However, they have been the first to benefit from the surge in enrolment, with the female GER rising from 44%

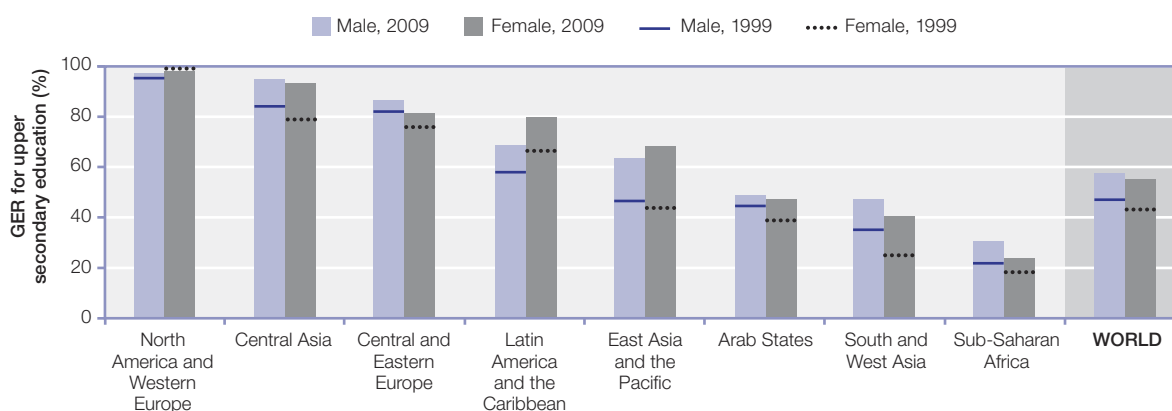

to 68%, which surpassed the male rate of 64% in 2009 (compared to 46% in 1999).

### Trends in upper secondary education completion: Most students are ready to pursue tertiary education

In general, access to upper secondary education has been growing, but how many students actually complete these programmes? Upper secondary school completion can be measured by the gross graduation ratio, which represents the total number of upper secondary education graduates expressed as a percentage of the population at the theoretical graduation age for this level of education (see **Box 6**).

**Figure 13** presents gross graduation ratios for 70 countries with available data in 2009. Data on upper secondary school completion were reported by 17 countries in the region of Central and Eastern Europe. In most of these countries, the gross graduation ratio—comprising both the programmes with and without direct access to tertiary education—exceeded 70%. The exceptions were Belarus, Croatia, Republic of Moldova and Turkey, where the ratio ranged from 24% to 65%. Most students in the region graduate from programmes intended to prepare them for tertiary education.

**BOX 6. Measuring upper secondary school completion**

The 1997 International Standard Classification of Education (ISCED97) classifies upper secondary education programmes into three different categories based on their destination, as follows:

- ISCED 3A: programmes designed to provide direct access to tertiary education in a straight path to PhD level programmes (ISCED 6).
- ISCED 3B: programmes designed to provide access to practical, occupationally-specific programmes (ISCED 5B).
- ISCED 3C: programmes designed to lead to the labour market or to post-secondary non-tertiary programmes (or to other upper secondary programmes).

The upper secondary gross graduation ratio is the number of graduates, regardless of age and programme, expressed as a percentage of the population at the theoretical graduation age for this level of education. In Figure 13, a distinction is made between graduates from programmes that are designed to provide access to tertiary education (ISCED 3A and 3B programmes) and programmes that do not lead to higher/tertiary education (ISCED 3C programmes).

However, for some countries, the total graduation ratio cannot be calculated as the sum of 3A, 3B and 3C programmes. Some countries have systems with upper secondary education structured into two phases, both with a graduation. This is common in countries with systems reflecting the Anglo-Saxon model with O-level completion, followed by A-level completion. In those countries, only graduates who complete the full upper secondary level cycle, including the second phase, are counted as having access to tertiary education.

To avoid overestimating the gross graduation ratio for upper secondary education, the final count of ISCED 3C graduates (i.e. those who will not go on to tertiary education) is adjusted by deducting the students who continue on to obtain a second certificate from ISCED 3B or 3A programmes.

In Central Asia, seven out of nine countries showed 60% or higher gross graduation ratios in upper secondary education programmes, all of which are designed to lead to tertiary education. The exception was Tajikistan, where the ratio was 44% in 2007.

One-half of countries with data in East Asia and the Pacific had graduation ratios of 80% or above. The ratio exceeded 90% in Australia; China, Hong Kong Special Administrative Region; and Japan. At the other end of the spectrum, less than one-half of the population at the theoretical graduation age for upper secondary education graduated in Indonesia and Thailand.

There was considerable variation in Latin American and the Caribbean, where graduation ratios for upper secondary education ranged from 39% in Guatemala to 70% in Peru. More than one-half of the student population at this level also graduated in the Plurinational State of Bolivia, Chile, Colombia and Cuba. With the exception of Cuba, El Salvador, Mexico and Panama, all upper secondary education programmes in countries with available data in this region prepared students for tertiary education.

In North America and Western Europe, gross graduation ratios were 70% or above in all countries with available data, except in Malta (68%) and Portugal (67%). Most of these graduates complete programmes that lead to tertiary education. Notable exceptions are Belgium, Denmark, Greece, Iceland, Luxembourg, Norway and the Netherlands, where at least one-quarter of students graduate from programmes designed to prepare them to join the labour force.

## **1.5 EDUCATIONAL ATTAINMENT: MEASURING A COUNTRY'S HUMAN CAPITAL**

This section presents data on educational attainment, which reflects long-term trends in participation and completion of primary, secondary and tertiary education over a period of several decades. Whereas current enrolment rates only provide information on the population in school at a given time, indicators of educational attainment summarise the level of education of the entire adult population. For this reason, educational attainment is not only a reflection

of the structure and performance of a country's education system, it is also an indicator of a country's human capital, which is one of the main determinants of economic growth.

The discussion begins with a description of the current state of educational attainment. For this analysis, educational attainment is measured in terms of the percentage of adults (25 years and older) who have completed primary, secondary or post-secondary education, defined according to ISCED (see **Box 7** and *Annex C*). This is followed by a closer look at gender disparity in educational attainment, with an emphasis on primary, lower secondary and upper secondary education. The section closes with an examination of long-term trends in educational attainment in six selected countries.

### Educational attainment of adults: Central and Eastern Europe and Central Asia have reached high levels

The current state of educational attainment worldwide is summarised in **Figure 14**, with data for 129 countries grouped by geographic region (see also *Statistical Table 19*). For each country, the percentage of people aged 25 years and older who have reached the following educational attainment levels is plotted along the horizontal axis:

- at least completed primary education (ISCED 1 or more);
- at least completed lower secondary education (ISCED 2 or more);
- at least completed upper secondary education (ISCED 3 or more);
- post-secondary education (ISCED 4, 5, 6); and
- tertiary education (ISCED 5, 6).

#### BOX 7. How the UIS measures educational attainment

In its measurement of educational attainment, the UIS refers to the International Standard Classification of Education (ISCED) (see *Annex C*). The UIS defines educational attainment as the highest ISCED level of education that an individual has successfully completed, where completion is typically certified by a recognised qualification.

The UIS calculates indicators of educational attainment for national populations aged 25 years and older because it is assumed that by this age most adults should have completed at least primary and secondary education (ISCED 1 to 3). For this purpose, the Institute conducts an annual survey that collects data on the highest level of education completed by age groups spanning 5 to 10 years, from ages 15 to 85 and older, disaggregated by gender and area of residence (urban or rural). The data are gathered mainly from national population censuses and nationally representative household surveys, including labour force surveys.

In its annual survey, the UIS seeks the distribution of a country's population among eight groups of educational attainment: no schooling, incomplete primary education, complete primary education (ISCED 1), complete lower secondary education (ISCED 2), complete upper secondary education (ISCED 3), complete post-secondary non-tertiary education (ISCED 4), complete tertiary education (ISCED 5 and 6), and unknown attainment. The national data for these categories are listed in *Statistical Table 18*.

This report adds a new indicator for educational attainment in *Statistical Table 19*: the cumulative percentage of the population that has attained at least primary, lower secondary, upper secondary, post-secondary and tertiary education.

The data on educational attainment can be interpreted in two ways (UIS, 2009). First, a relatively high concentration of the adult population in a given level of education reflects the long-run capacity of a country's education system for the corresponding level of education. Second, educational attainment is a measure of the skills and competencies of a country's population and, thus, an indicator of the quantitative and qualitative aspects of the stock of human capital. A low stock of human capital reduces the potential for economic growth and indicates a need for policies aimed at increasing educational attainment and, thus, human capital.

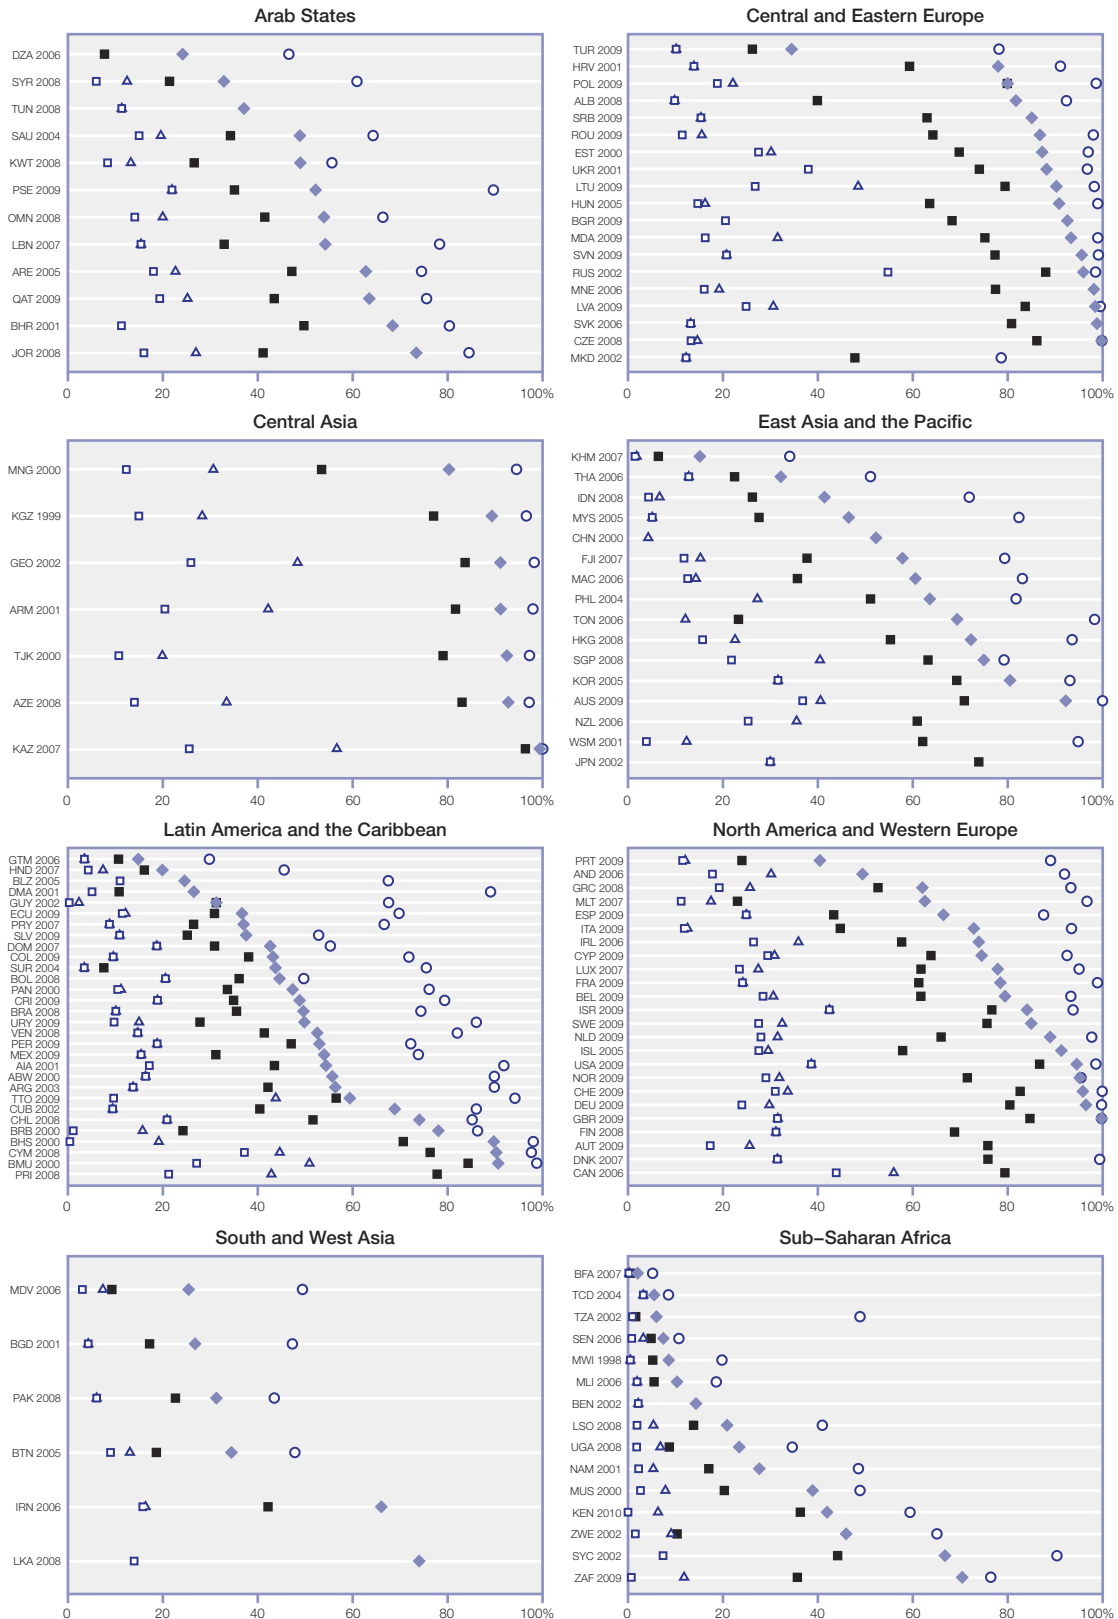

**FIGURE 14**

**In which countries have most adults completed secondary education?**

**Educational attainment of the population aged 25 years and older, by region, 1998-2010**

- Tertiary education (ISCED 5 and 6)
- ▲ Post-secondary education (ISCED 4, 5 and 6)
- At least upper secondary education (ISCED 3)
- ◆ At least lower secondary education (ISCED 2)
- At least primary education (ISCED 1)

Percentage of population with at least ISCED 1, 2, 3, 4 or 5

**Note:** Countries are identified by their three-letter ISO code (see *Annex D*) and the year of data collection. Countries in each region are arranged by the share of the population with at least ISCED 2 or ISCED 3 (for countries without ISCED 2 data).

**Source:** UNESCO Institute for Statistics, Statistical Table 18.

In two regions, Central and Eastern Europe and Central Asia, most countries have reached high levels of educational attainment at the primary and secondary levels, a legacy of education under the former communist regimes. In both regions, at least 4 out of 5 adults have completed lower secondary education. Moreover, universal lower secondary education has been almost achieved in countries such as the Czech Republic, Latvia, Montenegro and Slovakia in Central and Eastern Europe, as well as in Kazakhstan in Central Asia.

Upper secondary education has been attained by at least 80% of the population aged 25 years and older in 6 of 19 countries with data in Central and Eastern Europe, and 5 of 7 countries in Central Asia. The exception is Turkey, where only 35% of the population has at least lower secondary education and only 26% has at least upper secondary education. In the former Yugoslav Republic of Macedonia, the share of the population who completed at least lower secondary education is unknown and the share with at least upper secondary education is relatively low, at 48%. On average, a greater percentage of the adult population attained upper secondary education in Central and Eastern Europe and in Central Asia than in other regions.

The remaining regions are characterised by more variation in educational attainment across countries. In the Arab States, the share of the population who attained at least lower secondary education ranges from 24% in Algeria to 73% in Jordan. A similar distribution pattern can be seen in South and West Asia, where the share of the population that completed lower secondary education ranges from 25% in the Maldives to 74% in Sri Lanka. For India, the largest country in the region, no data on educational attainment are available.

As Figure 14 shows, East Asia and the Pacific and Latin America and the Caribbean resemble each other in terms of educational attainment. Both regions include countries or territories where the stock of human capital is low (such as Cambodia, Thailand, Guatemala and Honduras) or high (such as

Australia, the Republic of Korea, Bermuda and Puerto Rico). In China, about one-half of the population aged 25 years and older had completed at least lower secondary education according to data from the 2000 census, but only 4% had post-secondary education; these values are likely to be higher when data from the 2010 census become available.

In Latin America and the Caribbean, educational attainment tends to be higher in the small island nations of the Caribbean, with attainment rates for lower secondary education as high as 90% in the Bahamas, Bermuda and the Cayman Islands. In most other countries in that region, fewer than 60% of the adult population completed lower secondary education.

In North America and Western Europe, primary education is near universal. On the other hand, secondary education is not common among the adult population of several countries, including Andorra, Cyprus, Greece, Ireland, Italy, Malta, Portugal and Spain. In these countries, many members of older generations only completed primary education in their youth, whereas younger cohorts are more likely to continue their education at the secondary and post-secondary levels.

Very low levels of educational attainment set sub-Saharan Africa apart from the other regions. In 11 out of 15 countries with data, less than one-half of the adult population completed primary education; in 5 countries, this is true for less than 1 in 5 adults. Lower secondary education was completed by less than one-half of the population in 13 of the 15 countries, and by less than 20% in 7 countries. In countries such as Burkina Faso, Chad, Malawi, Mali, Senegal and the United Republic of Tanzania, only 1 in 10 adults completed lower secondary education. This low educational attainment and resulting lack of human capital can partly explain the low level of economic development in these and similar countries.

Nonetheless, there are some bright spots. In Seychelles and South Africa, respectively 90% and 76% of the adult population completed primary

education; the attainment rates for lower secondary education in these two countries are 67% and 70%, respectively, based on the latest available data. In addition, access to primary and secondary education is expanding throughout sub-Saharan Africa (see *Sections 1.1 to 1.4*), and over time the increased enrolment rates among children and adolescents of today will lead to measurable improvements in the educational attainment of the adult population, a phenomenon that is discussed in more detail in the section on national trends in educational attainment.

Access to post-secondary education is conditional on graduation from upper secondary education, and attainment of ISCED levels 4, 5 or 6 is, therefore, higher in countries with high upper secondary completion rates. As Figure 14 shows, the gap between upper secondary and post-secondary education is, in general, greater than the gap between primary and lower secondary or lower and upper secondary education. This is especially obvious in Central Asia, where on average 80% or more of the population aged 25 years and older completed upper secondary education, but less than one-half of this age group continued their education at the post-secondary level. Post-secondary education is most common in North America and Western Europe and least common in sub-Saharan Africa, where those who have graduated from post-secondary education constitute a small minority of the population.

### **Gender disparity in educational attainment: Far-reaching and significant consequences**

The analysis of gender disparity in educational attainment reveals not only to what extent the right to education has become a reality for men and women worldwide, it also indicates the distribution of economic opportunity within a country. Economic empowerment is inextricably linked to literacy and numeracy and increases with the level of education. Women who lack formal education are less able to make full use of their productive potential. Educational attainment also has direct consequences on health and other aspects of family life, because

women are often the primary caretakers of children and other relatives in the household.

Figure 14 summarised data on the percentage of the population aged 25 years and older with completed primary, lower secondary, upper secondary, post-secondary and tertiary education. In **Figure 15**, the same data (see *Statistical Table 19*) are used to calculate the GPI (the ratio of female to male values) for the share of the population with completed primary, lower secondary and upper secondary education. Post-secondary and tertiary education are shown in Figure 14 but not included in Figure 15. GPI values between 0.97 and 1.03 (highlighted by the shaded area in the regional graphs) indicate parity between men and women.

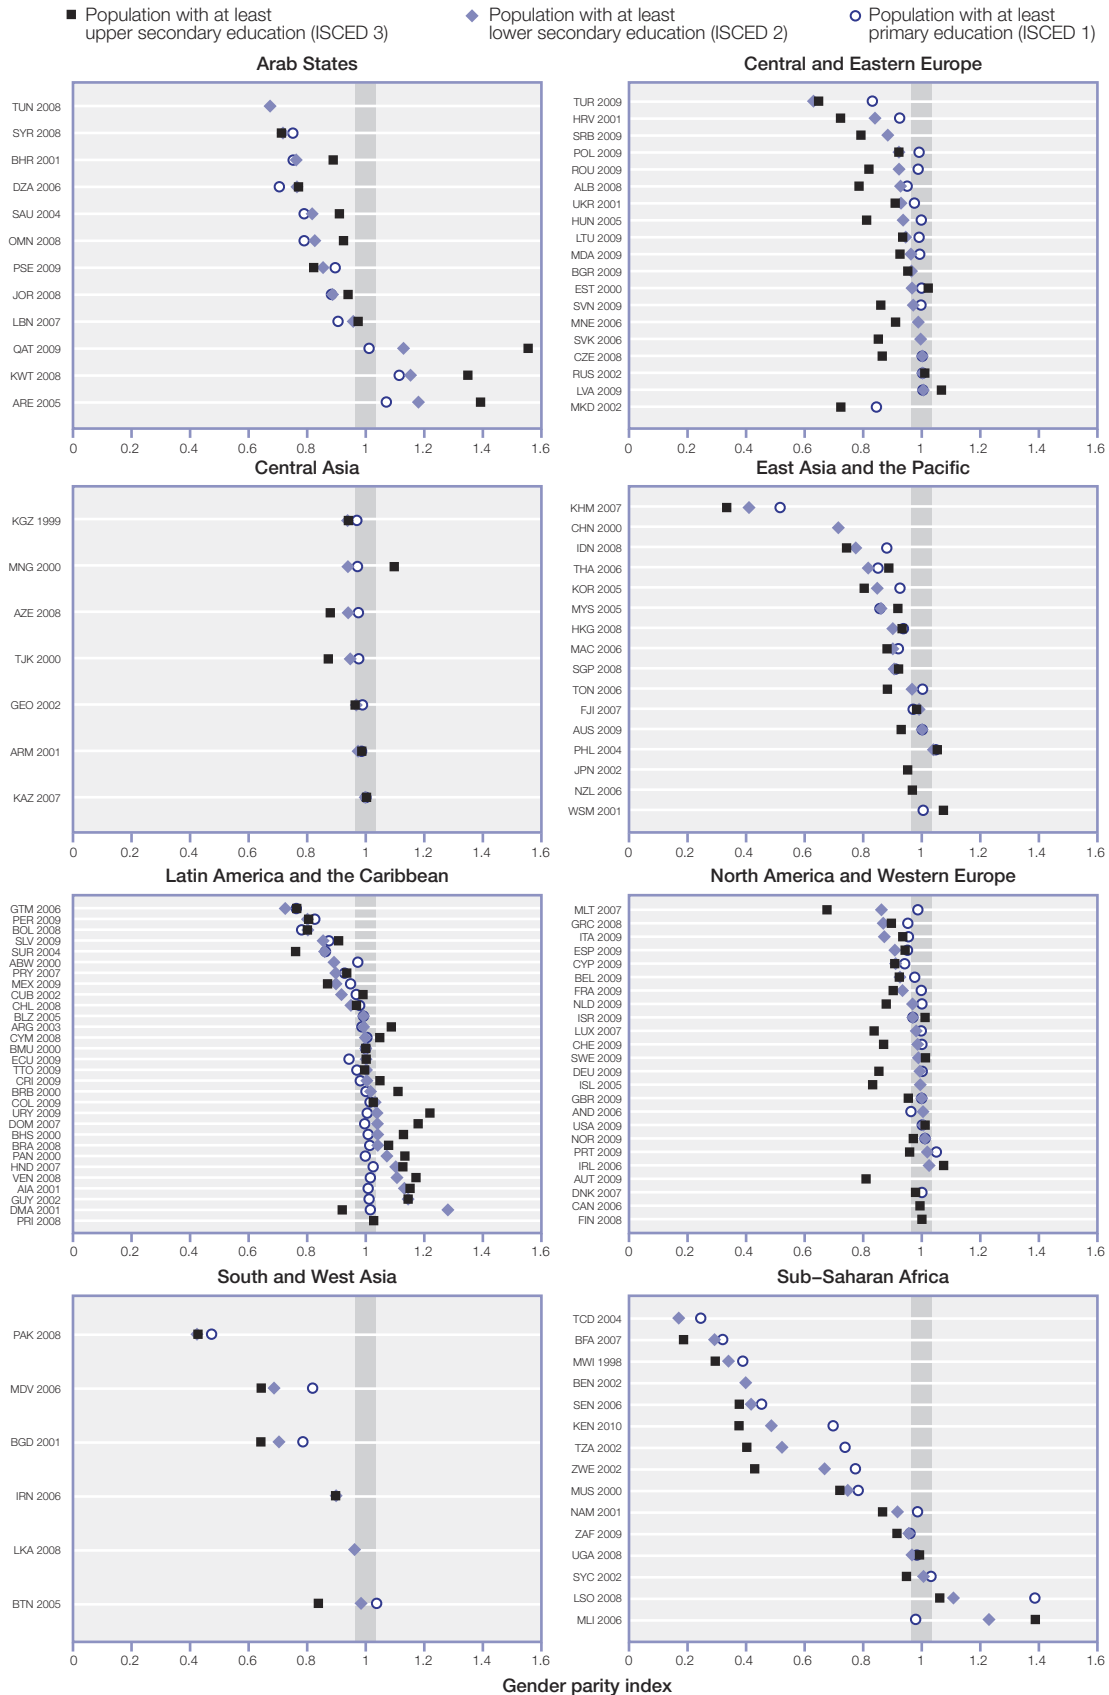

A comparison of Figure 15 with Figure 14 reveals that the GPI values for the countries within a region vary less than the underlying percentages of the population that have attained a given level of education. For example, in Algeria, Lebanon and the Syrian Arab Republic, there are considerable differences in the percentage of the population aged 25 years and older with completed primary, lower secondary or upper secondary education. By contrast, the GPI values for these attainment levels are very similar within each of the three countries. This means that if there is gender disparity, it is often observed to similar degrees across the three levels of education. In the Syrian Arab Republic, for example, women are 25% less likely than men to have attained at least primary education, as indicated by a GPI of 0.75. The respective GPI values for attainment of lower and upper secondary education in the Syrian Arab Republic are 0.72 and 0.71.

In Figure 15, some striking regional patterns emerge. In most of the Arab States, women have lower educational attainment than men, but in Kuwait, Qatar and the United Arab Emirates the opposite can be observed. The disparity in favour of women in these countries may be explained by the fact that local women have on average higher educational attainment than the male migrant workers who make up a large part of the population.

**FIGURE 15**

**Which countries have reached gender parity in educational attainment?**

**Gender parity index of the educational attainment level of adults aged 25 years and older, by region, 1998-2010**

**Note:** Countries are identified by their three-letter ISO code (see *Annex D*) and the year of data collection. Countries in each region are arranged according to the GPI of the share of the population with at least ISCED 2 or ISCED 3 (for countries without ISCED 2 data). The shaded area indicates gender parity (GPI between 0.97 and 1.03).

**Source:** UNESCO Institute for Statistics, Statistical Table 19.

Most countries in Central and Eastern Europe are at gender parity with regard to primary education completion, but at higher levels of education there is gender disparity to the disadvantage of women, who are less likely than men to have completed lower or upper secondary education. This can be seen in Hungary, Romania and Slovenia, for example. In Albania, Croatia, The former Yugoslav Republic of Macedonia and Turkey, women are disadvantaged at all levels of educational attainment.

Central Asia has high levels of attainment and near gender parity for primary and lower secondary education. There is some disparity in attainment of upper secondary education, but compared to other regions, the gaps between men and women in educational attainment are relatively small.

In East Asia and the Pacific, only a few countries are at gender parity in educational attainment, including Fiji, Australia and Tonga. For the latter two, however, gender parity has been reached only at the primary and lower secondary levels. In most other countries of the region, women are less likely to have completed primary, lower secondary or upper secondary education. The Philippines stands out as the one country in East Asia and the Pacific where women have higher educational attainment than men at all three levels of education, which is the result of a long-running trend of higher school enrolment rates among girls than boys.

By far the biggest disparity exists in Cambodia, with GPI values of 0.51 (ISCED 1), 0.41 (ISCED 2) and 0.33 (ISCED 3). This means that women are half as likely as men to have attained primary and one-third as likely to have attained upper secondary education. To some extent this can be explained by the demographic structure of Cambodia, where nearly two-thirds of the population over 50 years of age are female. The disproportionately large number of older, less educated women has a relatively high weight in the calculation of the GPI, whereas the male population is largely composed of younger, more educated men. In other regions, GPI values as low as

in Cambodia are only observed in several countries of sub-Saharan Africa and in Pakistan.

The region of Latin America and the Caribbean is unique because it is dominated by countries where women are more likely than men to have attained lower and upper secondary education, such as Anguilla, Bahamas, Brazil, Dominican Republic, Guyana, Honduras, Panama, Uruguay and the Bolivarian Republic of Venezuela. The same countries have achieved gender parity in primary education, which means that men and women are equally likely to complete primary education, but more women continue their education at the secondary level. In the region, however, there are also several countries with gender disparity favouring men at all levels of education, including the Plurinational State of Bolivia, El Salvador, Guatemala, Peru and Suriname.

The pattern of gender parity in educational attainment in North America and Western Europe is similar to what is seen in Central and Eastern Europe and Central Asia. Most countries are at or near gender parity for primary and lower secondary educational attainment, but in certain countries of the region women are less likely to have completed upper secondary education (for example, Germany, Iceland, Luxembourg, the Netherlands and Switzerland).

South and West Asia is mostly characterised by lower educational attainment for women. The exception is Bhutan, where women are more likely than men to have completed primary education and equally likely to have completed lower secondary education; men in Bhutan are, on the other hand, more likely to have advanced to the upper secondary level of education. As in Central and Eastern Europe and in North America and Western Europe, women in South and West Asia are overall less likely to have attained higher levels of education than men.

Sub-Saharan Africa does not only have lower educational attainment than other regions, it is also the region with the greatest gender disparity against women. In addition, a pattern observed in other

regions is repeated in sub-Saharan Africa: increasing levels of education are associated with increasing gender disparity. This is most obvious in Kenya, the United Republic of Tanzania and Zimbabwe. The GPI values for primary education completion in these three countries are 0.70, 0.74 and 0.77, respectively. For completion of lower secondary education, the GPI drops to 0.48, 0.52 and 0.67, and for upper secondary education the GPI values are as low as 0.37, 0.40 and 0.43. The greatest gender disparity in educational attainment exists in Benin, Burkina Faso, Chad, Malawi and Senegal. In these countries, less than one-half as many women as men have completed any formal education.

Yet, there are exceptions: Mali, Namibia, Seychelles, South Africa and Uganda are at or near gender parity for primary level completion, and the same is true in the last three countries for lower secondary education. Women in Mali are more likely to have completed secondary education, but the absolute percentage of men and women who have completed lower secondary education is very low. In Lesotho, women have higher attainment than men at all levels of education, a result of the herder tradition, where many young boys are sent to work tending livestock while girls go to school.

In summary, many countries in Central and Eastern Europe, Central Asia, Latin America and the Caribbean, and North America and Western Europe have reached gender parity in educational attainment, at least for the primary level. Where gender disparity exists, it is usually to the disadvantage of women. There are also some countries where average educational attainment is higher among women than among men, most notably in Latin America and the Caribbean, but also in some Arab States and in a few countries in sub-Saharan Africa.

**National trends in educational attainment: Younger cohorts usually do best; long-term commitment is essential**

It can take decades for countries to move from a situation of low educational attainment to higher

levels of attainment, because older cohorts are usually unlikely to increase their level of education. Massive adult education programmes that bring primary or secondary level education to a large part of the population are costly and difficult to administer. Adult literacy programmes, which are more common, usually have no measurable outcome on educational attainment indicators.

Instead, efforts to increase the stock of human capital are typically concentrated on younger cohorts of school-going age. As younger, more educated cohorts replace older and less educated cohorts in the population, the average level of educational attainment tends to increase, while gender disparities diminish. This is demonstrated with the data in **Figure 16**, which presents educational attainment data by gender and age group for six selected countries.

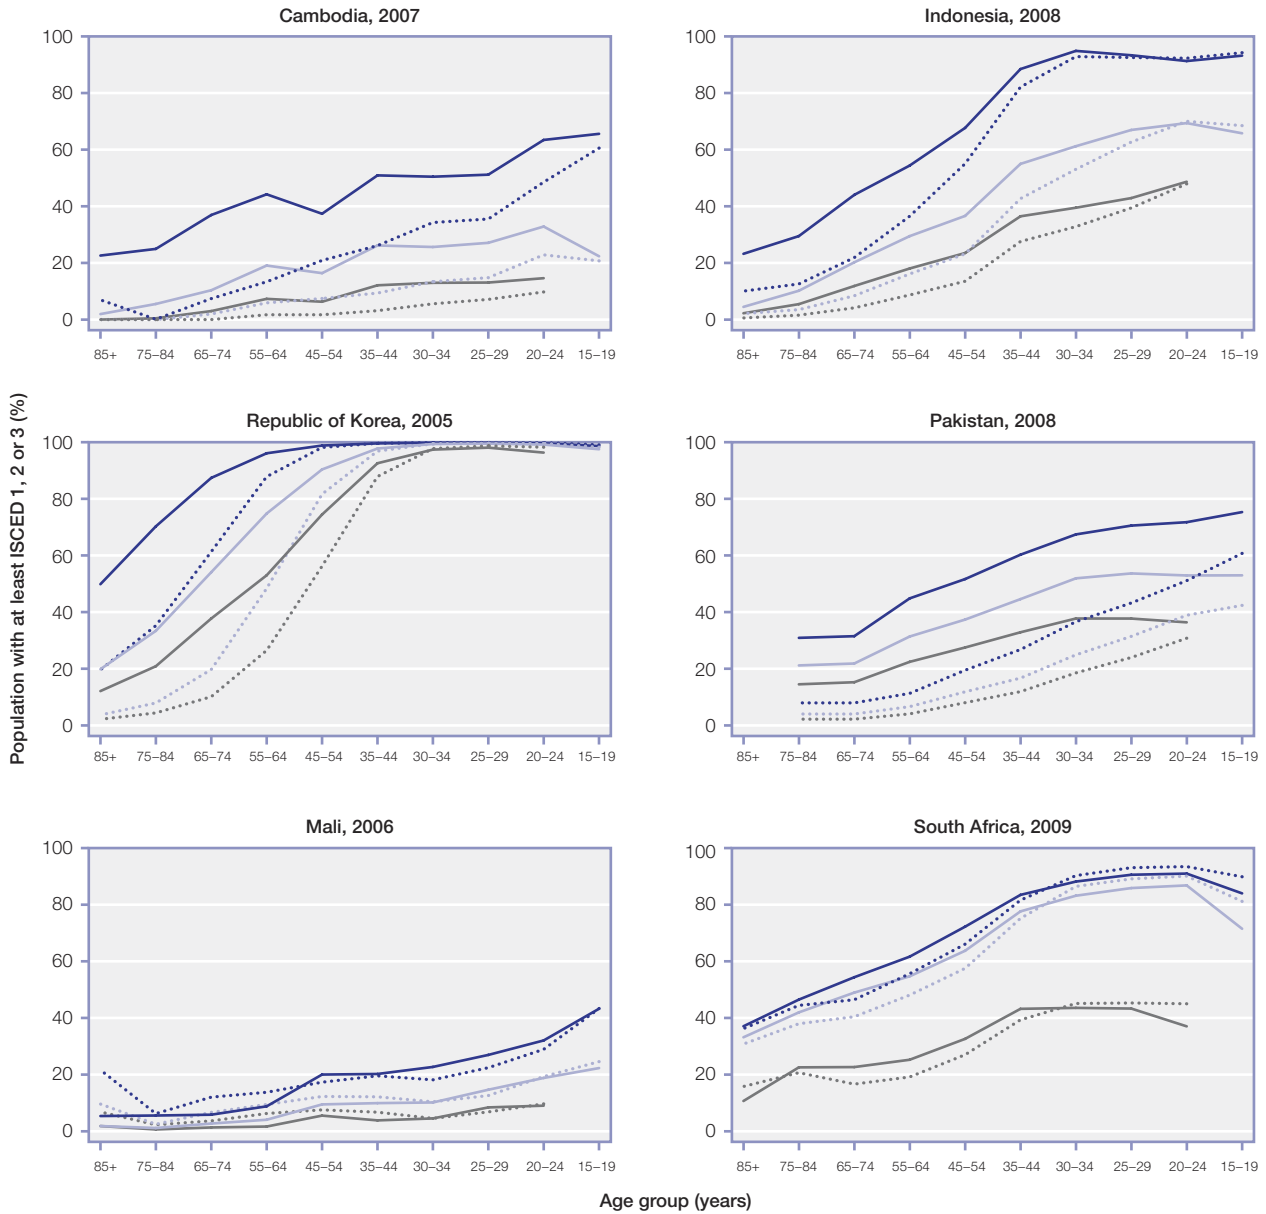

At first glance, it is obvious that levels of educational attainment have increased over time. Younger cohorts generally have higher educational attainment than older cohorts, but the rate of increase varies and is closely linked to the trends in enrolment described in preceding sections of this report.

Three countries in East Asia and the Pacific—Cambodia, Indonesia, and the Republic of Korea—serve as examples of very different trends in educational attainment. Cambodia lags far behind the other countries in the region due to slow progress over the past decades. A partial explanation can be found in the fact that there has been no increase in educational attainment among the 25- to 44-year age group, which was of school-going age during the years of the civil war in Cambodia and the Khmer Rouge regime. Men who are between 45 and 54 years old have even lower educational attainment than those who are older or younger, because many educated men in this age group were victims of Khmer Rouge purges. A study by the UIS (2010b) demonstrates that the period of conflict in Cambodia not only interrupted the increase in educational attainment levels that can be observed among older age groups, it also contributed to lowering

**FIGURE 16**

Source: UNESCO Institute for Statistics database.

the levels of attainment among their children. On a positive note, Cambodia has managed to overcome gender disparity in educational attainment among the youngest age group.

Indonesia has been more successful with regard to educational attainment. Nearly everyone born since the 1980s has completed, or is likely to complete, primary education. Yet at the same time, completion of lower and upper secondary education remains out of reach for large parts of the population. In the 20- to 24-year age group, 92% have completed primary education, 70% have completed lower secondary education, and 48% have completed upper secondary education. In Indonesia, there is no gender disparity in access to and completion of primary or secondary education among the youngest age groups.

The Republic of Korea is exemplary in moving from a low level of educational attainment to universal primary and secondary education over a relatively short period. Nearly all adults born since the 1970s have completed upper secondary education. By comparison, among the generation born in the 1950s, only one-half of all men and one-quarter of all women have completed upper secondary education. This improvement in the stock of human capital was one of the key factors in the vast economic growth of the Republic of Korea during the second half of the 20<sup>th</sup> century.

Pakistan is the only country in Figure 16 with a large and persistent gender gap in educational attainment at all levels. In the group aged 15 to 19 years, 75% of young men and 61% of young women have completed primary education. For lower secondary education, the male and female values are 53% and 42%, respectively. For upper secondary education, rates of attainment are only available for the 20- to 24-year age group; the male value is 36% and the female value, 31%. Although the gap in educational attainment between men and women has narrowed over the past 50 years, it remains a concern for the country.

Finally, two examples from sub-Saharan Africa demonstrate the varied experiences across

countries. Mali, like many other countries in the region, is characterised by extremely low educational attainment, although progress has been made over time. In contrast to most other countries, gender has not been a determining factor for access to education in Mali, possibly because only a relatively well-off minority has the means to send its children to school, regardless of whether they are boys or girls.

In contrast, South Africa has experienced a steady expansion of access to primary and lower secondary education, even under the apartheid regime. However, it should be noted that these statistics do not contain information on the quality of education received by different population groups. In addition, it is possible that older age groups did not complete primary or lower secondary education while they were of official school-going age but only in later years. In the 20- to 24-year age group, 92% of the population has completed primary education and 89% has completed lower secondary education. On the other hand, only 41% of the same age group have completed upper secondary education. South Africa has also seen a reversal of gender disparities from lower attainment rates among older women to higher attainment rates among younger women, compared to men in the same age groups.

Educational attainment varies widely between and within regions. Some regions, like Central and Eastern Europe and Central Asia, are home to populations with near universal primary and secondary education. In other regions, especially in large parts of sub-Saharan Africa, education remains out of reach for a large part of the population. Low educational attainment often coincides with gender disparity, usually to the disadvantage of women.

In addition to large differences in the current state of educational attainment in individual countries, there is a wide variety of historical trends in attainment of primary and secondary education. Most countries started with low levels of educational attainment, in particular among women, but managed to expand access to education over time, although some regions— notably sub-Saharan Africa— are lagging

behind. Nevertheless, the examples of countries like Indonesia, the Republic of Korea and South Africa show that a significant expansion of the stock of human capital is possible over the span of a few decades.

## 1.6 DISPARITIES IN ACCESS TO EDUCATION OF CHILDREN OF SECONDARY SCHOOL AGE

Despite progress towards equity in education, the educational opportunities of children around the world are significantly influenced by gender, socio-economic status and geographic location.

This section begins with an examination of current and historical data on lower secondary school-age children who are out of school. Regional and global estimates of the percentage and number of out-of-school children in 2009 are accompanied by a description of trends from 1999 to 2009. This is followed by a presentation of profiles of out-of-school children (who they are and where they live) to investigate how characteristics of children and the households in which they live interact as determinants of school attendance.

Attendance indicators, by definition, consider participation in a dichotomous manner: children of school-going age are either in school or out of school. In this section, we look beyond this dichotomy and examine three groups of out-of-school children based on their past and possible future exposure to education: those who have left school, those who are likely to enter school in the future, and those who are likely to never enter school. By understanding the past and expected schooling trajectories of out-of-school children, policies can be designed to better target specific education needs.

The section closes by examining the impact of late entry and grade repetition on school progression of upper secondary school-age adolescents in six countries. The analysis also sheds light on the likelihood of pupils to complete primary and

lower secondary education and continue with further studies.

### Regional estimates of out-of-school children: Latest data and historical trends

In 2009, 67.2 million children of primary school age (31.8 million boys and 35.4 million girls) and 71.6 million children of lower secondary school age (34.2 million boys and 37.4 million girls) were out of school, which means that they were enrolled neither in primary nor secondary education. These children represent 10% of the global primary school-age population and 17% of the global lower secondary school-age population (see *Statistical Table 5*). The distribution of children who are of lower secondary school age and who are out of school is shown by region in **Figure 17**.

Among children of lower secondary school age, the highest out-of-school rates in 2009 were reported in sub-Saharan Africa (37%), South and West Asia (21%), the Arab States (16%), East Asia and the Pacific (13%), and Central and Eastern Europe (11%).<sup>6</sup> In absolute terms, the highest number of children out of school was reported for South and West Asia: 27.1 million, or 38% of the global out-of-school population of lower secondary school age. Sub-Saharan Africa was home to 21.6 million, or 30%, of all lower secondary school-age children who are out of school worldwide. In East Asia and the Pacific, 14.1 million lower secondary school-age children were out of school in 2009.

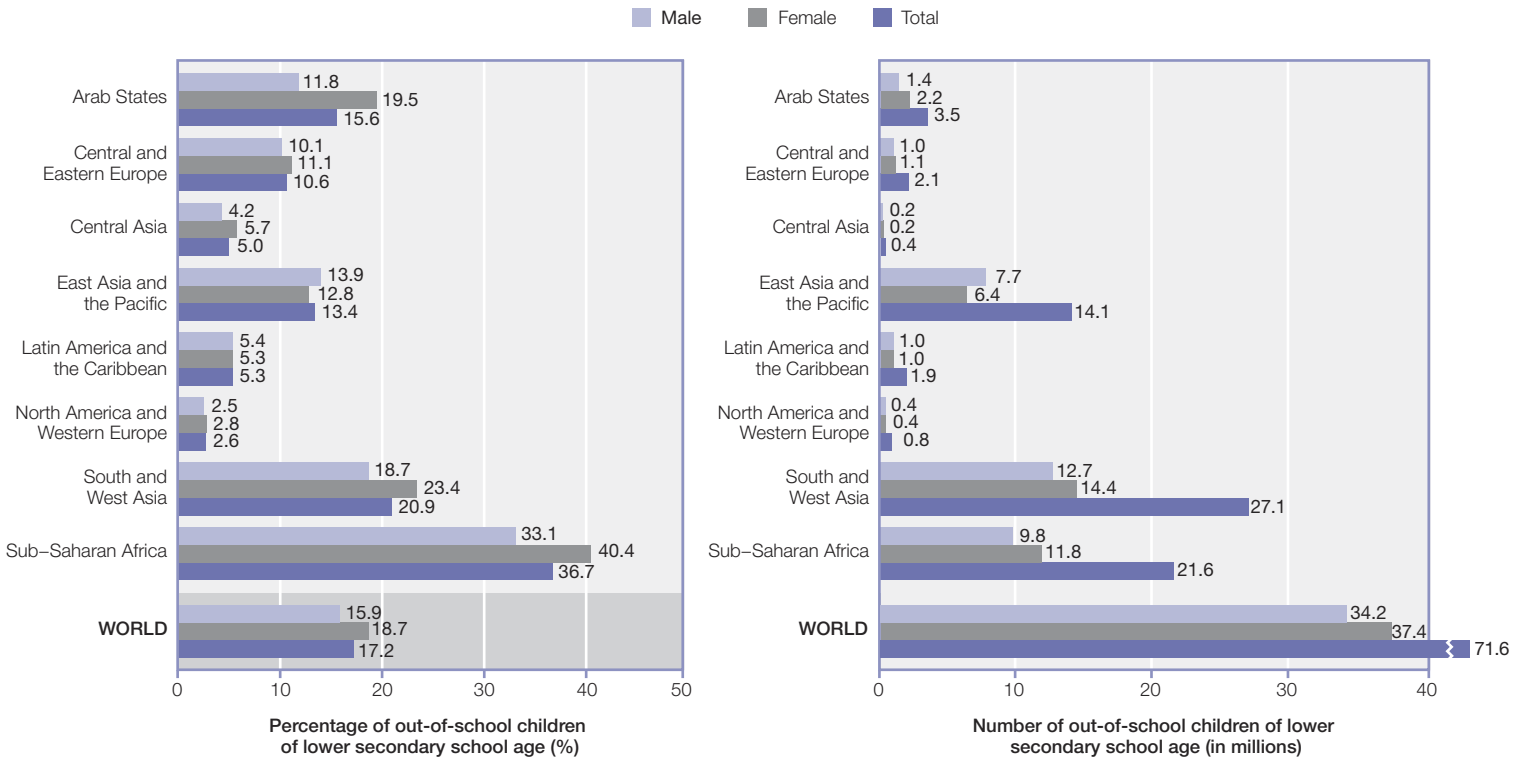

In almost all regions (except North America and Western Europe, Latin America and the Caribbean, and East Asia and the Pacific), out-of-school rates for lower secondary age were higher for girls than for boys. Gender disparity is generally greater among out-of-school children of lower secondary school age than among those of primary school age. For example, in sub-Saharan Africa, 40% of all lower secondary school-age girls and 33% of all lower

<sup>6</sup> East Asia and the Pacific and South and West Asia: UIS estimates based on data with limited coverage for the reference year, produced for specific analytical purposes.

**FIGURE 17**

**Where do the world's out-of-school children live?**

**FIGURE 18**

**Which regions have made progress in reducing their share of out-of-school children?**

Percentage of out-of-school children of lower secondary school age by region, 1999 and 2009

**Notes:** The start and end points of the arrows indicate the values in 1999 and 2009, respectively. For South and West Asia, the percentage of out-of-school children is only available for 2009. East Asia and the Pacific and South and West Asia: UIS estimates for 2009 are based on data with limited coverage, produced for specific analytical purposes.  
**Source:** UNESCO Institute for Statistics database and Statistical Table 5.

secondary school-age boys were out of school, compared to 25% of all primary school-age girls and 21% of all primary school-age boys (see *Statistical Table 5*).

Although a large number of children remain out of school in sub-Saharan Africa, this region has made the most progress in terms of reducing this share over the past decade. **Figure 18** compares the out-of-school rate of children of lower secondary school age in 1999 and 2009. In sub-Saharan Africa, the lower secondary out-of-school rate fell from 55% to 37% over this period, more than in any other region. Large reductions in the out-of-school rate were also observed in the Arab States (from 30% in 1999 to 16% in 2009).

Other regions showing a substantial decrease during this period in the share of lower secondary school-age children who are out of school are Central Asia (13% to 5%), East Asia and the Pacific (20% to 13%), and Latin America and the Caribbean (11% to 5%).<sup>7</sup> However, progress was not universal; in Central and Eastern Europe, the percentage of out-of-school children increased from some 7% in 1999 to 11% in 2009.

At the global level, the lower secondary out-of-school rate fell from around 24% to 17% over the past decade. By comparison, the primary out-of-school rate fell from 16% to 10% over the same period.

### Compounding disadvantage and the impact on school participation

Over the last decade, many countries have sought to reduce the participation gap between girls and boys, spurred by international commitments to achieve gender parity in primary and secondary education. Yet, the *Global Education Digest 2010* showed that, while girls and boys increasingly participate at the same rate in school, gender continues to be an important determinant of school participation (UIS, 2010a).

<sup>7</sup> East Asia and the Pacific: UIS estimate based on data with limited coverage for the reference year, produced for specific analytical purposes.

**Figure 19** combines the information on enrolment trends among children of lower secondary school age from Figure 18 with data on gender disparity, showing national trends in addition to regional averages. The horizontal axis indicates the share of children in school, defined as the percentage enrolled in primary or secondary education, and the vertical axis indicates the corresponding GPI or the ratio of female to male enrolment rates. The start and end points of the arrows indicate the values in 1999 and 2009, respectively. For countries and regions without trend data, only the values for 2009 are shown.

There is a clear trend towards increased enrolment and gender parity in lower secondary education between 1999 and 2009, both at the national and regional levels, similar to the pattern seen for children of primary school age (UIS, 2011b). By 2009, Central and Eastern Europe, Central Asia, East Asia and the Pacific, Latin America and the Caribbean, and North America and Western Europe had reached gender parity in the enrolment of lower secondary school-age children, with GPI values between 0.98 and 1.01.<sup>8</sup> On the other hand, the Arab States, South and West Asia, and sub-Saharan Africa on average have not reached gender parity for lower secondary school-age enrolment, in spite of significant progress since 1999. The world as a whole barely reached gender parity in access to education, reflected by a GPI of 0.97 and 83% of all lower secondary school-age children enrolled in school.

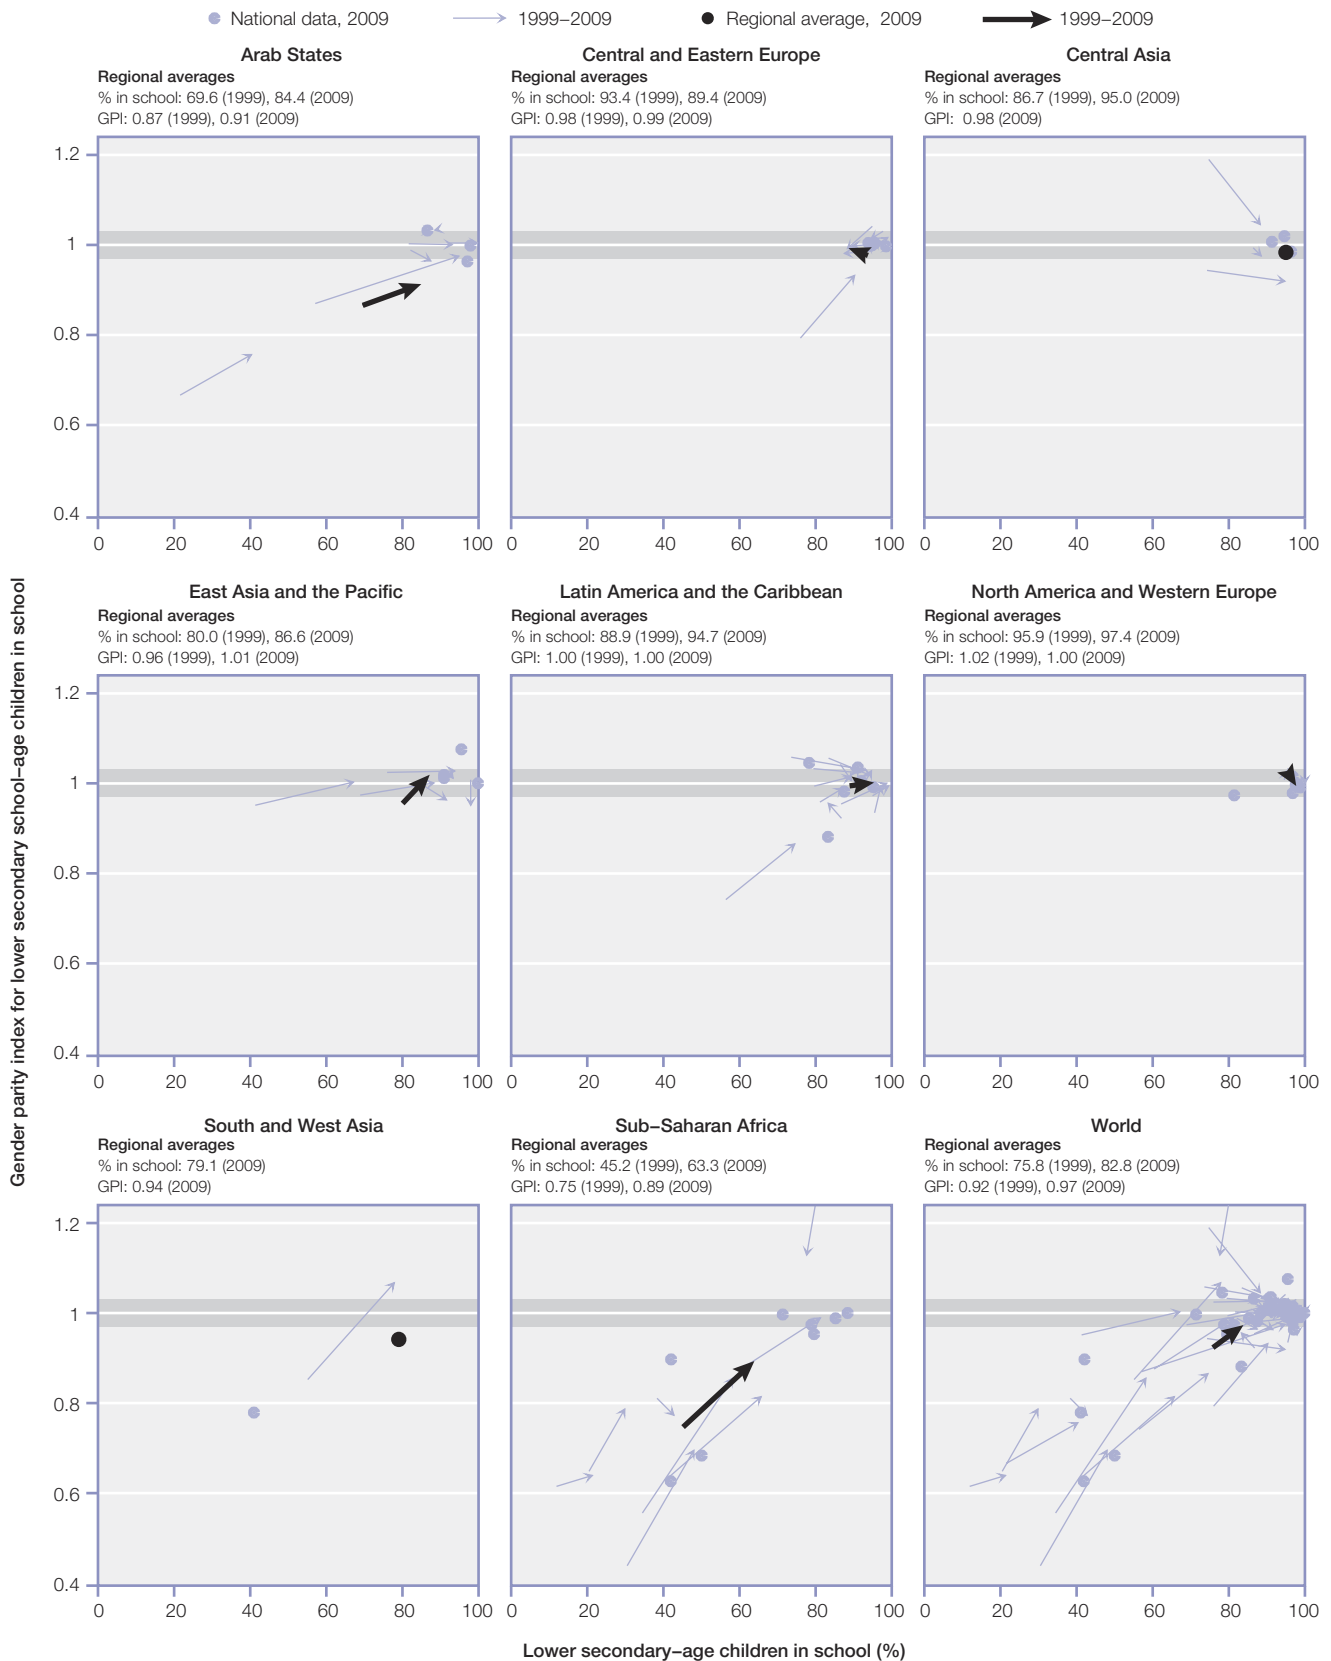

In some countries, progress towards gender parity in school enrolment of lower secondary school-age children was especially strong between 1999 and 2009, including Ethiopia (from GPI 0.56 to 0.86), Guinea (from 0.44 to 0.70), and Mozambique (from 0.63 to 0.81). Compared to primary school-age children, gender disparity to the disadvantage of girls is less widespread among lower secondary school-age children. Of 90 countries with data, 8 had GPI values greater than 1.03, among them Bhutan, Jamaica, Lesotho and Mongolia. In 21 countries, lower secondary school-age girls were at a disadvantage; GPI values were especially low in the Central African

<sup>8</sup> GPI values between 0.97 and 1.03 indicate parity between boys and girls.

**FIGURE 19**

**Has the gender gap among lower secondary school-age children who are in school decreased over time?**

**Enrolment and gender disparity among lower secondary school-age children, 1999-2009**

**Notes:** The shaded area indicates gender parity (GPI between 0.97 and 1.03). For Central Asia and South and West Asia, regional averages are only available for 2009. East Asia and the Pacific and South and West Asia: UIS estimates for 2009 are based on data with limited coverage, produced for specific analytical purposes.

**Source:** UNESCO Institute for Statistics database.

Republic (0.63), Niger (0.64), Mali (0.68), Guinea (0.70), and Djibouti (0.76). In these countries, girls of lower secondary school age are at least one-quarter less likely to be enrolled in primary or secondary education than boys. The remaining 61 countries with data had reached gender parity by 2009.

Figure 19 provides a snapshot of the gender balance in enrolment at the lower secondary level of education. Most countries have reached gender parity. Where there continues to be disparity, it tends to be to the disadvantage of girls, in spite of progress over the past decade. However, gender parity in enrolment does not represent meaningful progress if enrolment rates for both sexes are low.

Gender's effect on school participation is mediated by other factors, like household wealth and geographic location. In particular, gender plays a role as a determinant of school attendance among disadvantaged groups, such as children from poor households. Understanding these dynamics increasingly relies on analysis of disaggregated household survey data to explore how gender interacts with other characteristics of children to produce education disparities.

**Figure 20** presents the attendance rates of children of lower secondary school age and explores disparities linked to gender, geographic location and household wealth. The data are from 59 nationally representative household surveys, including Demographic and Health Surveys (DHS) and Multiple Indicator Cluster Surveys (MICS). The percentage of lower secondary school-age children who are in school is shown for the total population in that age group, and by combinations of gender, area of residence and household wealth. In addition to the cross-national averages, national values are indicated by smaller circles, which represent one country each.

The most important disparities in lower secondary school attendance are linked to household characteristics: urban or rural residence and household wealth. The average attendance rates of boys and girls are similar (80% and 76%,

respectively), but there are large gaps between children from rural and urban areas, and between children from wealthy and poor households.

Gender can interact with these other characteristics to create a compound disadvantage. This effect is evident when comparing the gender gap between girls and boys from the poorest households (63% compared to 70%) and girls and boys from the richest households (85% compared to 90%), and most strikingly, between girls from the poorest household quintile and boys from the richest quintile (63% compared to 90%). There is also a gender gap in rural and urban areas, to the disadvantage of girls in both cases.

The regional averages for each group of disaggregation discussed above conceal a wide range of attendance rates at the national level. In some groups, the national values are close to the cross-national average, whereas in other groups, the national values are more widely dispersed around the mean value. As an example, in all 59 countries, lower secondary school-age boys from the richest households have an attendance rate at or above 60%. By contrast, for girls from the bottom two household wealth quintiles, the national attendance rates cover nearly the entire range of possible values between 0% and 100%.

### Out-of-school children's past and future exposure to education

Although frequently viewed as a group with no exposure to formal education, out-of-school children have a wide range of experiences with the education system. A typology of out-of-school children developed by the UIS divides these children into three basic groups based on school exposure (see **Box 8**). First, the typology distinguishes children who have attended school at some point in the past but have since dropped out. The remaining children, who never entered school, can be divided into two additional groups: those who are not in school but are likely to attend in the future, and those who are unlikely to ever attend school.

FIGURE 20

The findings of an assessment of the expected school career of today's primary school-age children who are out of school are important because they have direct implications for secondary education policy planning and policies aimed at educational opportunities for secondary school-age children. The data in **Figure 21** reveal that a large proportion—about 30%—of primary school-age children who are out of school will attend school when they are older. However, delayed entry into the education system makes it increasingly difficult to complete primary education and continue at the secondary level. Over-age students are at higher risk of low academic achievement and dropping out before completing primary and secondary education. The final part of Section 1.6 will explore in more detail how late entry, in combination with other factors such as repetition, affects age-

appropriate enrolment of upper secondary school-age adolescents.

For the majority of out-of-school children of primary school age, the prospects for access to secondary education are bleak. Over one-half of the world's primary school-age children (51%) who are not attending school are expected to reach adulthood without ever entering a classroom. While in some cases these children may participate in non-formal education, most will grow up without any exposure to formal schooling.

The remaining 19% of out-of-school children of primary school age have already left school or dropped out in the majority of cases. The consequences of dropping out depend on when it occurs. For example, children who leave school in

### BOX 8. Typology of out-of-school children

In 2005, the UIS proposed a unique method of analysis with the idea that not all out-of-school children have never attended, and will never attend, school. In fact, out-of-school children can have a range of different experiences with education systems, and this population can, thus, be divided into three theoretical categories based on past and future school exposure (UIS, 2005a):

- Children who have left school;
- Children who will enter school in the future; and
- Children who will never enter school.

In data on enrolment and attendance from administrative records and household surveys, only out-of-school children in the first group, those who were in school in the past, can be identified and counted. The size of the two other groups of out-of-school children cannot be precisely measured, because it is not possible to predict with certainty whether an individual out-of-school child will enter school in the future.

In order to be able to translate these theoretical concepts into statistical terms, it is necessary to use probability analysis to estimate the likelihood that an out-of-school child will eventually attend school. For this purpose, current and past trends of school attendance can be analysed to estimate the proportion of the out-of-school population that is likely to attend school at some point in the future, and the proportion that is unlikely to attend. The three groups in the typology of out-of-school children can then be described as follows:

- *Children who have left school* are children who attended primary or secondary school in previous years but do not attend school at present.
- *Children who are likely to enter school in the future* are children who have not yet attended school but are expected to do so, based on estimated probabilities of future school attendance.
- *Children who are unlikely to ever enter school* are the remaining children who have never attended school and are unlikely to ever attend.

Analysis of out-of-school children by school exposure was published in recent editions of the *Education for All Global Monitoring Report* (UNESCO, 2008; UNESCO, 2010; UNESCO, 2011). In 2010, the classification of out-of-school children by school exposure was included as a key component in the methodological framework for the UNICEF/UIS Global Initiative on Out-of-School Children (UNICEF and UIS, 2011).

early primary grades often acquire no or only basic skills in reading, writing and numeracy. Other early school leavers may complete primary education and not make the transition to secondary, or may attend secondary education but drop out before completion. Although early school leavers can in theory return to school, research shows that most do not.

hand, most out-of-school children in East Asia and the Pacific, Latin America and the Caribbean, and North America and Western Europe can be expected to attend school in the future as late entrants. In Central and Eastern Europe, equal shares of out-of-school children are expected to attend school in the future and to never attend.

Figure 21 also shows the regional distribution of the out-of-school population in the three groups described above. In the two regions with the largest number of out-of-school children—sub-Saharan Africa (30.1 million) and South and West Asia (16.3 million)—more than one-half of them are likely to be permanently excluded from education. Most out-of-school children in Central Asia and the Arab States are also unlikely to ever enter school. On the other

Understanding the expected school trajectory of children can help policy planners to target more effectively specific interventions that have been tailored to meet the educational needs of the country's out-of-school population. For example, if the majority of primary school-age children who are out of school is expected to never enter school, policymakers can develop second chance education programmes in order to provide opportunities

**FIGURE 21** In which regions are out-of-school children likely to attend school in the future, and in which are they likely never to attend?

Source: UNESCO Institute for Statistics database.

for these children as they reach adolescence or adulthood. On the other hand, policymakers of a country whose out-of-school population is primarily comprised of children who will enter school late could focus on programmes aimed at increasing age-appropriate enrolment in primary education, and adapting curricula to accommodate over-age students of secondary school age.

### Educational experiences of upper secondary school-age adolescents

As children become older, their educational attainment reflects the accumulation of past experiences with education, including whether they entered primary school on time or late, whether they passed each grade on the first attempt or repeated grades, whether they dropped out and re-entered, and whether they made the transition to secondary education or not. This educational legacy can be observed, in part, through analysis of data on age-appropriate enrolment. The existence of severe lags in enrolment underscores major challenges for schools, whose teachers must adapt the curriculum to significantly over-age pupils, and also for timely and successful completion of compulsory education and beyond.

**Figure 22** examines the extent to which upper secondary school-age adolescents attend school and are enrolled at the appropriate level for their age. The figure shows attendance rates for girls and boys, for children in urban and rural areas, and for children from the richest and poorest wealth quintiles. The horizontal axis indicates access to education: the percentage of upper secondary-age adolescents who attend any level of formal school. The vertical axis reveals to what extent these adolescents in school are actually enrolled at a level appropriate for their age: upper secondary or higher education.

The analysis reveals that in many countries high attendance rates of upper secondary school-age adolescents belie the fact that many of these students are over-age and attend school at the primary or lower secondary level of education. These

lags in age-appropriate enrolment show that in some countries upper secondary school-age students are so severely behind that it is highly unlikely they will ever complete upper secondary school.

Each of the six countries shown in Figure 22 represents a different attendance pattern. In Ukraine, for example, most upper secondary school-age adolescents attend school and largely at a level that is appropriate for their age (i.e. upper secondary or a higher level of education). The notable exception is boys from the poorest households, who are less likely to be in school or, if they do attend, are often not at the appropriate level for their age.

In Egypt, access is the major problem. Large disparities exist in school participation rates between poor, rural children and their rich, urban counterparts. However, among children who are in school, more than 90% are enrolled at the appropriate level for their age, regardless of their household circumstances. Poor children are not considerably more behind in school than rich children.

Relatively high attendance rates for both boys and girls in Liberia belie significant disparities in participation. Figure 22 reveals an almost 50 percentage point gap in attendance rates between rich boys and poor girls. Girls from poor and rural households have the lowest participation rates. In addition, there is a severe age-level discrepancy affecting upper secondary school-age students from all households, rich and poor, urban and rural: less than 20% actually attend upper secondary or higher education.

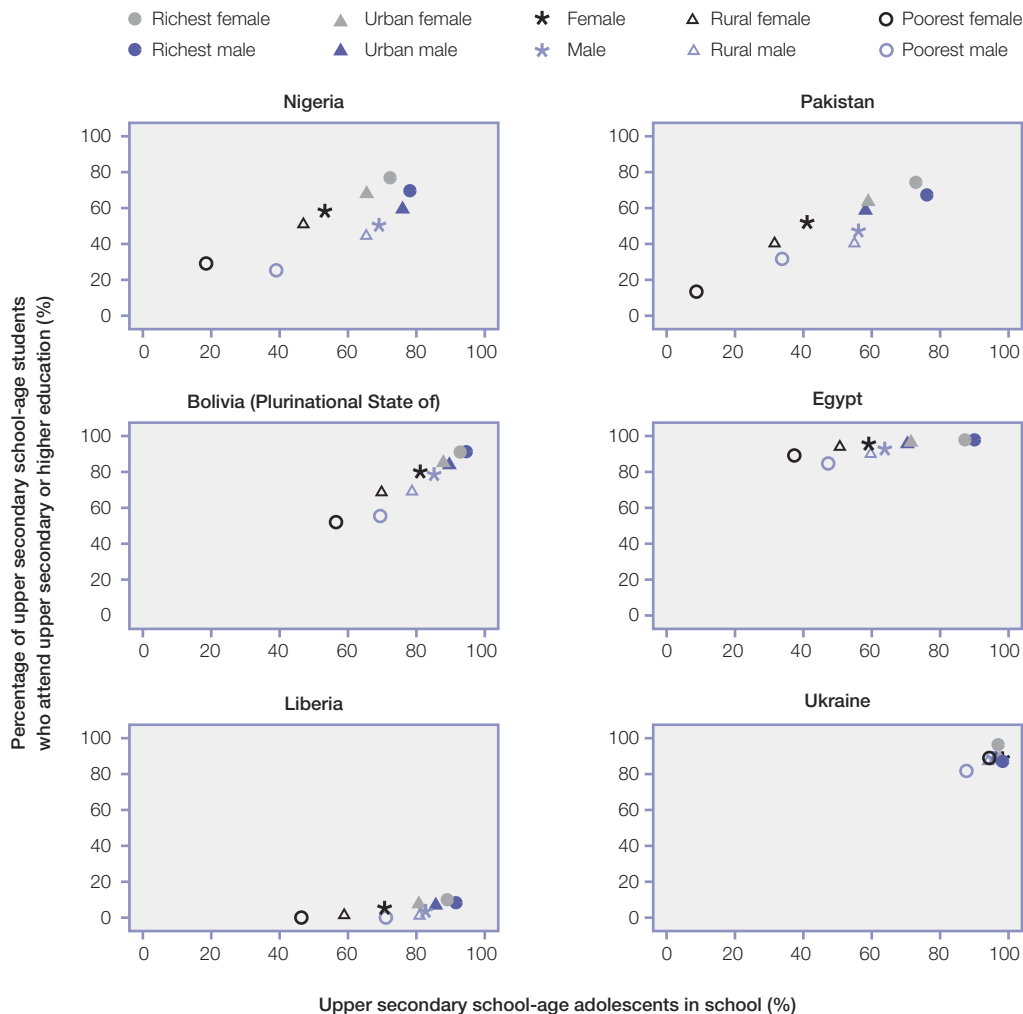

In the Plurinational State of Bolivia, Nigeria and Pakistan, there are striking disparities in both participation rates and age-appropriate school attendance. In these countries, gender, household wealth, and urban or rural residence determine to a large extent whether children will attend school at the appropriate level, and also whether they attend school at all.

Wealth and area of residence are key determinants of school attendance for upper secondary school-age

FIGURE 22

### Which upper secondary school-age adolescents are in school, and which are enrolled at the appropriate level for their age?

Percentage of upper secondary school-age adolescents who are in school, and the percentage of upper secondary school-age students who attend upper secondary or higher education in selected countries, by gender and other characteristics, 2007 or 2008

Source: Bolivia: DHS 2008, Egypt: DHS 2008, Liberia: DHS 2007, Nigeria: DHS 2008, Pakistan: DHS 2006-07 and Ukraine: DHS 2007.

children in the Plurinational State of Bolivia. Rich or urban children are much more likely to be in school, and to attend upper secondary school, than their poor, rural peers. Only about one-half of all students aged 14 to 17 years from the poorest households are enrolled in upper secondary education; the remaining members of this group are lagging behind and attend lower secondary or primary school.

Similarly, wealth, gender and area of residence are linked to educational opportunities for upper

secondary school-age adolescents in Nigeria and Pakistan. There is a wide gap in participation rates and age-appropriate attendance between girls from the richest households (the highest achieving group for both countries) and girls from the poorest households. In Nigeria, girls are less likely to attend school than their male peers, yet those who are in school are more likely to attend the appropriate level for their age. The same holds true for Pakistan, except for upper secondary school-age girls from the poorest households who face a double

disadvantage: they are the least likely to be in school and the least likely to be enrolled at the upper secondary level of education.

This analysis reflects the findings of the 2010 *Global Education Digest*, which identified access as a phenomenon that particularly affected girls' participation in secondary education, while boys were more likely to encounter barriers within the school system, such as repetition, which can lead to over-age enrolment (UIS, 2010a).

### **Much progress in participation, but many children are still left behind**

In the past ten years, countries have made vast strides towards increasing attendance in primary and secondary education, but 72 million lower secondary school-age children remain out of school. These children face complex, compounding disadvantages that prevent their full participation in education. A key challenge for policymakers is to identify the children who are out of school and the barriers that prevent their participation in education. Comprehensive profiles of out-of-school children, which identify key personal and household characteristics, as well as past and expected school exposure, can help target interventions aimed at expanding participation in education.

For example, while some of the world's out-of-school children will enrol in school in the future as late entrants, more than one-half are likely never to enter a classroom. National policy responses must vary depending on the extent of school experience of the out-of-school population. Countries whose out-of-school population is characterised mostly by dropout require different education interventions than countries where most out-of-school children will likely never attend school. School exposure is also mediated by gender, geographic location, household wealth and other factors.

In addition to enrolment, equity in secondary school participation has also progressed significantly in the last ten years. Nonetheless, gender disparities

continue to persist. In many countries, gender parity at the national level conceals large gaps in participation between poor girls and poor boys, or rural girls and rural boys. Similarly, high enrolment rates may conceal disparities in age-appropriate enrolment. Students who are severely over-aged face a greater risk of dropping out of school before they can catch up with the appropriate level of studies for their age group. To reduce this mismatch between pupils' ages and their school grade, efforts must be made at every stage of the education trajectory: enrolling children in school at the appropriate age, preventing repetition or dropout, and ensuring a smooth transition to secondary education and beyond.

## **1.7 TECHNICAL AND VOCATIONAL EDUCATION AND TRAINING**

This section looks at trends in technical and vocational education and training (TVET) mainly within the context of secondary education. It is not easy to capture the status of TVET because it has many different components that interact in very diverse ways. This section thus begins by presenting the complexity of TVET and then analyses its present status based on available data and information.

### **Defining TVET**

Defining TVET is often problematic because programmes are extremely heterogeneous in terms of content, frequency and duration. The main objective of TVET is to develop or maintain job-relevant skills for employment or for entry into the labour market. Job-relevant skills can be defined as a set of competencies valued by employers and useful for self-employment, including skills relevant to a specific job and other skills that enhance a worker's productivity (World Bank, 2010b). According to the International Labour Organisation (ILO), skills development connects education to technical training, technical training to labour market entry, and labour market entry to the workplace and lifelong learning, which help countries sustain productivity and translate growth into more and better jobs (ILO, 2008).

For UNESCO, TVET is a part of the process of lifelong learning, which plays a crucial role in reducing poverty and increasing the likelihood of finding decent work or generating income through self-employment (UNESCO, 2009). From the point of view of those who participate in TVET, especially unemployed young people, TVET that does not result in employment is a waste of time and resources. The UIS and UNESCO's International Centre for Technical and Vocational Education and Training (UNEVOC) have defined TVET as “a range of learning experiences which are relevant to the world of work and which may occur in a variety of learning contexts” (UIS and UNESCO-UNEVOC, 2006). This concept is captured by a narrower definition of “vocational education”, which is used for data collection and international comparisons. According to ISCED, vocational education is a programme that prepares participants for direct entry into the labour market and provides labour-market relevant vocational qualifications to successful completers (UIS, 2010c).

At the national level, systematically collected data are available only for a limited part of overall TVET provision, and generally these data concern programmes that are offered in the formal education system (see **Figure 23**). Theoretically, the national data collection system requested by the UIS covers all types of formal vocational education programmes, and ISCED covers both formal and non-formal programmes.

However, systematic data collection of vocational education programmes outside of the formal school system is limited to particular countries with strong accreditation or regulating bodies, such as qualifications-awarding agencies and national sectoral or professional organizations. This is because there is no unified system of governance in TVET, which makes it difficult to capture the myriad of training programmes (UIS and UNESCO-UNEVOC, 2006). Since TVET is multi-sectoral, data collection cannot be restricted to the formal school system. For example, TVET in sub-Saharan Africa cannot be analysed properly without collecting information

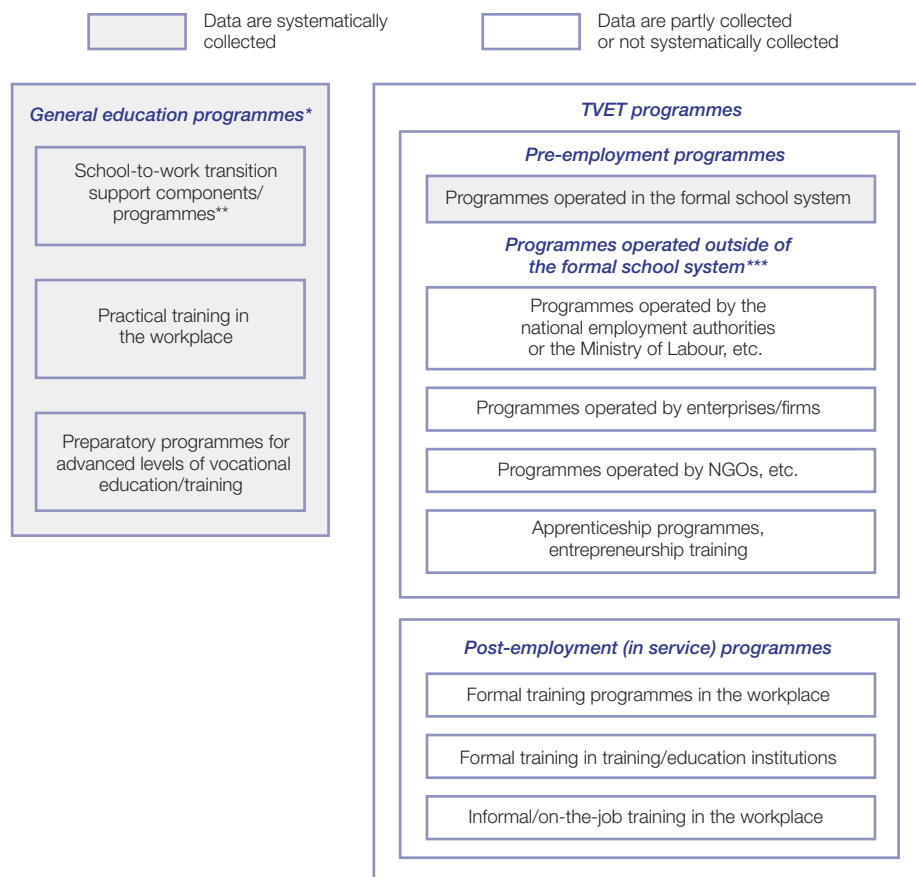

on the programmes provided at non-formal training facilities. However, provision of these programmes is random and non-organized, as no single agency has responsibility for TVET, and in particular for the skills development of young people (UNESCO-BREDA, 2009). Moreover, while some TVET programmes implemented outside of the formal school system provide formal education qualifications, such information has not yet been systematically collected by national authorities in many countries.

### **Monitoring Goal 3 of the Dakar Framework for Action: Ensuring appropriate learning and life skills programmes**

TVET has been analysed in the context of Goal 3 of the Dakar Framework for Action which stipulates “that the learning needs of all young people and adults are met through equitable access to appropriate learning and life skills programmes” (UNESCO, 2000). However, the Dakar Framework for Action does not provide targets for developing skills for young people and adults (UNESCO, 2010). Goal 3 has been left open to widely divergent interpretations, and the absence of any consensus on benchmarks has weakened the scrutiny of government actions in this area (UNESCO, 2011). There is little agreement about how to define life skills and which learning activities to include in the analysis of Goal 3. Consequently, there is no international consensus on a monitoring framework for this Goal (UNESCO, 2007 and 2008).

Despite the lack of an internationally agreed monitoring framework for Goal 3, recent EFA *Global Monitoring Reports* analyse skills necessary for employment and life skills, which is a core part of EFA objectives.<sup>9</sup> The 2010 report considers that the purpose of skills development is to equip people with capabilities that can broaden their opportunities in life, including social and work-related opportunities, such as citizenship and participation in community activities and to prepare young adults for the

<sup>9</sup> The Dakar Framework for Action defines the purpose of skills development as: “to develop their [all young people's and adults'] capacities to work, to participate fully in their society, to take control of their own lives, and to continue learning” (UNESCO, 2000).

**FIGURE 23**
**What kinds of cross-nationally comparable TVET data are available?**

**Notes:** \* Within general education programmes, TVET-related data are not distinguished from the rest of the general programmes.

\*\* School-to-work transition programmes are only included if they form part of formal education, but they are not explicitly distinguished as TVET-related activities.

\*\*\* Workplace training components are only included if they form part of formal education, but they are not explicitly distinguished as TVET-related activities. There are long-term "sandwich" training programmes, which divide one training programme into multiple training components, including school-based training and substantial workplace-based training. Often only the school-based component of such programmes is recorded and the workplace component is not, thus a substantial part of the training curriculum is not captured in data collection.

Source: Authors' elaboration.

transition from school to work. The report concluded that governments and employers need to cooperate to devise effective technical and vocational education that equips young people with the skills they need for success in employment (UNESCO, 2010). Likewise, the 2011 edition of the report stresses that increasing the supply of skilled labour without effective policies for promoting employment and increasing labour market demand will lead to failure; it also pointed to the importance of ensuring that young adults have the relevant skills for dealing with the realities of rapidly changing employment markets (UNESCO, 2011). Skills for employment will be the theme of the upcoming 2012 edition (see **Box 9**), which will analyse strategies for increasing employment opportunities for marginalised groups.

### TVET in secondary education: Specialised vocational programmes becoming less relevant

At the secondary education level, specialised occupations-specific TVET programmes in the formal school system are being reduced worldwide. A number of recent studies have concluded that TVET has become a less explicit part of secondary education systems. There is a global trend towards deferring specialisation, pushing vocational content to post-secondary education (Adams, 2007).

In the region of Asia and the Pacific, secondary-level TVET programmes have not met the demand of the labour market, so post-secondary TVET

programmes have higher priority (ADB, 2008). The situation is the same in Latin America and the Caribbean (IDB, 2000). In some countries in sub-Saharan Africa, it was found to be difficult to prioritise vocational programmes in secondary education curricula due to the high cost and complexity of these programmes and the urgent need to improve the quality of general core education subjects, including language, mathematics and science (Lauglo et al., 2002). Yet, in many countries in the region, there is a growing demand for further learning and skills acquisition in TVET at the upper secondary level for the graduates of lower secondary education.

However, informal settings—rather than formal education institutions—are increasingly delivering TVET to students who are already employed and desire to upgrade their skills or prepare for new job opportunities (Verspoor et al., 2008). Furthermore, some studies have shown that including vocational courses as a minor part in general secondary-level curricula gives students an advantage when seeking work in the labour market (ADB, 2009).

Changing academic to vocational content in secondary schools, however, does not reduce unemployment, and diversifying curricula at the secondary level does not make graduates more employable (ADB, 2009). At this level, the line between general and vocational curricula is shifting and fading, and achieving a balance between general and TVET programmes at the secondary education level is becoming increasingly irrelevant (World Bank, 2005). These findings indicate that the traditional dichotomy between general programmes and specialised occupations-specific vocational programmes has become less pertinent for analysing the situation of TVET in secondary education.

The move towards an information society, where more and more jobs are provided by the service sector, is also having a profound effect on TVET. Technical and vocational education and training for the service sector may consist of training in soft skills and the use of information and communication technologies (ICTs) to carry out office tasks and work with colleagues effectively. Such skills are seen as “general skills” instead of occupations-specific skills,

#### **BOX 9. 2012 Education for All Global Monitoring Report on skills development: Expanding opportunities for marginalized young people**

The 2012 EFA *Global Monitoring Report* will focus on skills development, emphasising strategies that increase job opportunities for marginalised young people. The Report will draw lessons from skills training programmes that have succeeded in supporting the development of economically dynamic and socially inclusive societies.

Governments that were already grappling with long-term consequences of the financial crisis and the challenges posed by increasingly knowledge-based economies now face the need to respond to recent political upheavals, including in parts of the Arab world, sub-Saharan Africa and Europe. These have turned the spotlight on a generation of youth driven by a vision of a world without undemocratic leadership, corrupt politics and slow economic progress that have thwarted their hopes for decent jobs and better lives. Many have not been able to continue schooling beyond primary school. Many others have left secondary school without having acquired the skills that employers need, confining them to unemployment or informal work that is insecure, poorly paid and often dangerous. And in some parts of the world, economic failures mean that jobs are not being created fast enough to meet the needs of rapidly increasing youth populations.

The Report will highlight the ways in which investing in young people through skills training programmes can address their frustrations, enhance their opportunities, and help them and their families move towards a better life. It will explore the public policy approaches needed to extend employment-relevant training to vulnerable groups, while examining the responsibilities of the public and private sectors for providing, financing and managing skills training programmes.

**FIGURE 24**
**To what extent has TVET enrolment decreased over time?**

**Changes in the regional average of upper secondary TVET enrolment as a percentage of total upper secondary enrolment, 1999 and 2009**

**Note:** Central Asia is not included due to the reclassification of general and vocational programmes in Azerbaijan in 2008.

**Source:** UNESCO Institute for Statistics database and Statistical Table 6.

and in many countries employers' organizations expect the education system to provide graduates with proficiency in this area.<sup>10</sup> These changes have created a demand for international assessments, such as the Programme for International Student Assessment (PISA) and the Trends in International Mathematics and Science Study (TIMSS). Both PISA and TIMSS measure the acquisition of skills and knowledge needed for today's world.

Despite the rise in the global GER for upper secondary education since 1999, enrolment in TVET programmes as a percentage of total enrolment at this education level has generally decreased or only slightly increased in all regions of the world (see **Figure 24**).

<sup>10</sup> For example, these "general skills" can be described as a set of competencies valued by employers and also useful for self-employment, including: i) problem-solving skills; ii) learning skills (ability to acquire new knowledge); iii) communication skills; iv) personal skills for management and judgment; and v) social skills (teamwork, leadership, social networking) (World Bank, 2010b).

Over the past decade (1999-2009), the percentage of enrolment in TVET programmes at the upper secondary level has fallen from 34% to 20% in the Arab States, from 43% to 38% in East Asia and the Pacific, and from 31% to 26% in North America and Western Europe, but it has increased from 9% to 16% in sub-Saharan Africa. At the country level, the upper secondary GER has increased in many countries, but the percentage of enrolment in TVET programmes has decreased. For example, in Colombia, the GER increased from 58% to 77%, but TVET enrolment decreased from 61% to 28%. In Djibouti, the GER increased from 7% to 18%, but TVET enrolment decreased from 34% to 15%. Similarly, in Morocco, the GER increased from 25% to 37%, but TVET enrolment decreased from 15% to 5% (see **Table 2**). This indicates that growing numbers of upper secondary students are enrolled in general programmes, while the opposite is true for TVET programmes.

Some developing countries that had relatively higher percentages of enrolment in TVET programmes did not show high GER in upper secondary education in 2009, such as Guatemala (enrolment in TVET 88%, GER 47%), Ethiopia (enrolment in TVET 59%, GER 15%), Mali (enrolment in TVET 40%, GER 26%) and Rwanda (enrolment in TVET 49%, GER 17%). This indicates that these populations have a strong preference for TVET programmes in secondary education. However, such figures may also be misleading as the line between TVET and general education has become more blurred. In the meantime, a lesson from countries that provided TVET programmes successfully is that high levels of literacy, numeracy and broad-based general education are the real foundation for flexible and transferrable vocational skills, a foundation that many developing countries lack (UNESCO, 2010).

While the participation of female students in TVET programmes at the upper secondary level has increased, their overall secondary enrolment is still lower than that of male students. Between 1999 and 2009, the percentage of young women enrolled in TVET programmes in upper secondary education

**TABLE 2. Changes in TVET enrolment as a percentage of total enrolment and in gross enrolment ratios for upper secondary education, selected countries (1999 and 2009)**

increased in many countries, particularly in sub-Saharan Africa, including Chad (36% to 46%), Ethiopia (21% to 46%), Ghana (22% to 38%), Kenya (29% to 58%), Togo (25% to 43%) and Mozambique (23% to 35%). However, in 2009, enrolment in upper secondary TVET programmes was still lower for young women than for young men in most countries (see *Figure 25*). The participation of women in upper secondary TVET programmes is one of the factors

that might influence their employment status. As such, it can be analysed with other factors, such as their participation in TVET programmes provided outside of the formal education system and the demand for female workers in the labour market by industry and occupation.

In summary, it is possible to say that the dichotomy between general education programmes and

**FIGURE 25**

**Has female participation in TVET programmes increased?**

Source: UNESCO Institute for Statistics database and Statistical Table 6.

specialised occupations-specific TVET programmes at the secondary education level is becoming obsolete. International trends show that formal secondary education tends to be a minor provider of such TVET programmes. They also show that general education programmes are including more vocational components to help students understand the world of work, and that specialised job-relevant TVET programmes are increasingly provided at the post-secondary education level. When analysing TVET at the secondary level, instead of looking at general and TVET programmes separately, it would make more sense to examine how vocational and general components are being integrated and how this could help students prepare for their career development and future participation in vocational and/or professional training.

In conclusion, information on overall TVET provision needs to be collected and analysed. TVET programmes provided in the formal education system represents only a limited part of overall TVET. The ministry of labour, national employment and training authorities, and enterprises are major providers of TVET programmes in many countries. Moreover, information on skills supply systems needs to be collected and analysed from major TVET programme providers which are usually not in the formal education system. It is also essential to collect and analyse information regarding the demand for skills, job creation, investment climate and employment services that link the supply of skills with demand.

## SECONDARY SCHOOL TEACHERS, THE LEARNING ENVIRONMENT AND EDUCATIONAL QUALITY

In the years to come, expanding secondary education will be a key factor for improving social development and economic growth. Section 1.2 shows that the number of secondary school pupils worldwide grew from 196 million in 1970 to 531 million in 2009. However, while improving rates of access to and completion of secondary education are important, improving the quality of secondary education is also essential for equipping children with a basic level of knowledge and a useful set of skills needed to succeed in today's world.

For countries still striving to meet the international goal of UPE, additional demands to develop secondary education represent significant challenges, particularly where human and financial resources are tightly constrained. In particular, countries will increasingly need to consider policies targeting secondary education teachers. According to Mulkeen (2010), a successful policy for teachers should effectively address the following four interconnected challenges:

- Supply: training a sufficient number of teachers, including in specialised subjects;
- Distribution: ensuring a sufficient number of qualified teachers, with a fair gender composition and with geographical equity in deployment;
- Quality of teaching: this should be achieved through quality pre-service training, as well as continuous professional development, management and pedagogical supervision; and
- Cost: countries at various stages of social and economic development have to meet these challenges in the context of budget constraints and other competing educational priorities.

This section examines both quantity and quality issues related to secondary-level teachers,

instruction and classroom processes. It addresses a range of policy-oriented questions such as: how has the number of secondary school teachers grown over the past two decades? Who are secondary teachers and what are the implications for the composition of this workforce in the future? What types of qualifications do these teachers need to have and what level of salary is adequate to attract and retain qualified teachers? What kinds of workloads do teachers have in terms of instructional hours, and how is the teaching of subjects distributed to ensure secondary school pupils are getting a balanced education? Finally, this section briefly examines international student assessment data in the context of available school resources and their influence on students' reading achievement.

While focusing primarily on secondary education, comparisons to primary education are made for analytical purposes. Moreover, wherever available, the data are disaggregated into lower and upper secondary education to better capture varying trends. This is particularly important from a policy perspective, given differences in how countries organize and provide secondary educational opportunities.

### Dramatic rise in the number of secondary teachers

**Table 3** shows that the total number of secondary teachers grew by 50%, from 20.3 million to 30.4 million between 1990 and 2009. During the same period, the number of primary teachers increased by 27%, from 22.2 million to 28.3 million. Globally, there have been more teachers working in secondary education than at the primary level since 2002.

**TABLE 3. How have total numbers of primary and secondary school teachers grown since 1990?**  
**Total number of primary and secondary school teachers by region, 1990, 2000 and 2009**

*Source:* UNESCO Institute for Statistics database and Statistical Table 8.

Regionally, there were substantial increases in the total numbers of teachers at both primary and secondary levels from 1990 to 2009; the only exception being Central and Eastern Europe, where the number of teachers has sharply declined. Since 1990, the total number of primary school teachers in this region dropped by 21%, while the total number of teachers at the secondary level fell by 20% since 2000. Worldwide, the level of growth among total numbers of teachers was generally linked to the demand for education at these levels. For example, growth in the stock of teachers was relatively modest in North America and Western Europe and in Central

Asia due to slower growth of the primary and secondary school-age population.

In contrast, there was substantial growth in teacher numbers in almost all other regions, particularly at the secondary level. In Latin America and the Caribbean, for example, the number of primary and secondary school teachers grew by 25% and 68%, respectively, since 1990, while in East Asia and the Pacific, the number of primary and secondary school teachers grew by 15% and 67%, respectively. In China, there was a large increase in the number of secondary school teachers because primary school enrolment

peaked in 1998, while enrolment at the secondary level continues to grow—having almost doubled between 1990 and 2009.

The biggest increases in total numbers of primary and secondary school teachers from 1990 to 2009 were observed in sub-Saharan Africa (79% and 157%), the Arab States (71% and 112%) and South and West Asia (49% and 83%).<sup>11</sup> In sub-Saharan Africa and South and West Asia (in particular in Afghanistan, India and Pakistan), growth has been especially rapid since 2000 with the passage of international agreements set out in the EFA Dakar Framework for Action. However, all three regions are still faced with acute teacher shortages in their bid to meet the EFA goals by 2015. For example, assuming an average regional PTR of 40:1, sub-Saharan Africa needs to increase its primary school teaching force to 4.0 million in order to achieve UPE by 2015, while the Arab States and South and West Asia need to increase their teaching workforce to 2.2 million and 4.9 million, respectively, by 2015 (UIS, 2011c).<sup>12</sup>

### **Age of secondary school teachers: Finding the balance between young recruits and more experienced teachers**

Data on teachers' ages and gender shed light on both potential opportunities and barriers in building and sustaining a well balanced and experienced teaching workforce. For example, countries with an ageing teaching workforce will need to anticipate significant losses to their education systems and recruit large numbers of younger teachers, who must nevertheless be trained and supported by sufficient numbers of more experienced teachers. In other countries, such as Gambia, unemployed or retired teachers have returned to work to help fill gaps (Mulkeen, 2010).

In Chile approximately 8% of primary and lower secondary teachers and 7% of upper secondary teachers are 60 years old or older. In response to this,

Chile has recruited many new young teachers to fill open teaching posts, with the proportion of all primary and lower secondary teachers aged under 30 years rising from 13% to 18% between 2007 and 2009. In the Philippines, the loss of teachers in the secondary education system is less severe, as only 4% of the teachers are aged 60 years or more, but a substantial loss of teachers will occur at the primary level, given that 16% of the teachers at this level are over 60 years.

While these examples from middle-income countries generally show primary school teachers as being older than their secondary-level counterparts, evidence from 26 high-income countries shows another pattern. In Italy, while 5% of primary-level teachers are aged 60 years or over, 8% of both lower and upper secondary teachers are in the same age group. Italy will experience high levels of teacher turnover in the next decade, given that slightly more than one-half of all lower and upper secondary teachers are aged 50 years or more. The proportion of secondary teachers who are 60 years old or older is also very high in Norway and Sweden, where 11% and 13% of lower secondary teachers and 17% and 18% of upper secondary teachers, respectively, fall into this age group.

In countries with high levels of teacher turnover, the teaching workforce will quickly become skewed with the massive entry of younger teachers over a relatively short period. This may have an impact on the quality of teaching, as there will be a lack of older, more experienced teachers to help mentor the new recruits. For example, in Indonesia, almost two-thirds of lower secondary teachers are under the age of 40, while 35% are under the age of 30.

### **Gender issues: Low share of female secondary teachers falls even further in sub-Saharan Africa**

Data on gender can also help educational planners make better use of untapped human resources by taking a more targeted approach to teacher training and recruitment. While there is no international target for the proportion of female teachers, there is a

<sup>11</sup> South and West Asia: UIS estimate based on data with limited coverage for the reference year, produced for specific analytical purposes.

<sup>12</sup> Ibid.

growing awareness that policies aimed at achieving gender balance in the teaching workforce are necessary, in particular since the teacher's gender may influence children's access, completion and overall achievement levels (Lewis and Lockheed, 2007; Lockheed and Mete, 2007; UIS, 2010a).

**Table 4** shows the proportion of female teachers in primary and secondary education globally and by region for the most recent year and for 1995, the year in which the Beijing Declaration and Platform for Action were adopted. The text in these 'Political Promise' documents states that female teachers should have the same opportunities and status as their male colleagues. It also stresses that female teachers are needed to attract and retain girls in school in many countries.

According to Table 4, the proportion of female teachers at all levels increased globally since 1995. The largest increase occurred in East Asia and the Pacific, where women now account for almost one-half (49%) of all secondary school teachers. The reverse is true in sub-Saharan Africa where the proportion of female secondary school teachers is not only the lowest of all regions, but this proportion has decreased from 33% to 29% between 1995 and 2009. The participation of women teachers at the

secondary level is also very low in South and West Asia (35%), while it is highest in Central and Eastern Europe (73%) and in Central Asia (71%).<sup>13</sup>

Table 4 also shows that the proportion of female teachers declines between primary and upper secondary levels of education. Globally, women account for 62% of primary school teachers, compared to 54% and 49% for the upper and lower secondary levels of education, respectively. For most regions, the gender gap in the teaching force is greatest between primary and lower secondary levels. In sub-Saharan Africa, the share of female teachers falls from 43% in primary education to 28% in lower secondary education.

There is also a substantial gender gap among teachers in East Asia and the Pacific, Latin America and the Caribbean, and North America and Western Europe; however, unlike sub-Saharan Africa, women represent the majority of lower secondary teachers in these regions. Across regions, the largest difference in the proportion of women in the teaching workforce between lower and upper secondary levels is found in the Arab States, where female

teachers represented a slight majority (51%) in lower secondary education and a minority (41%) in upper secondary education in 2009.

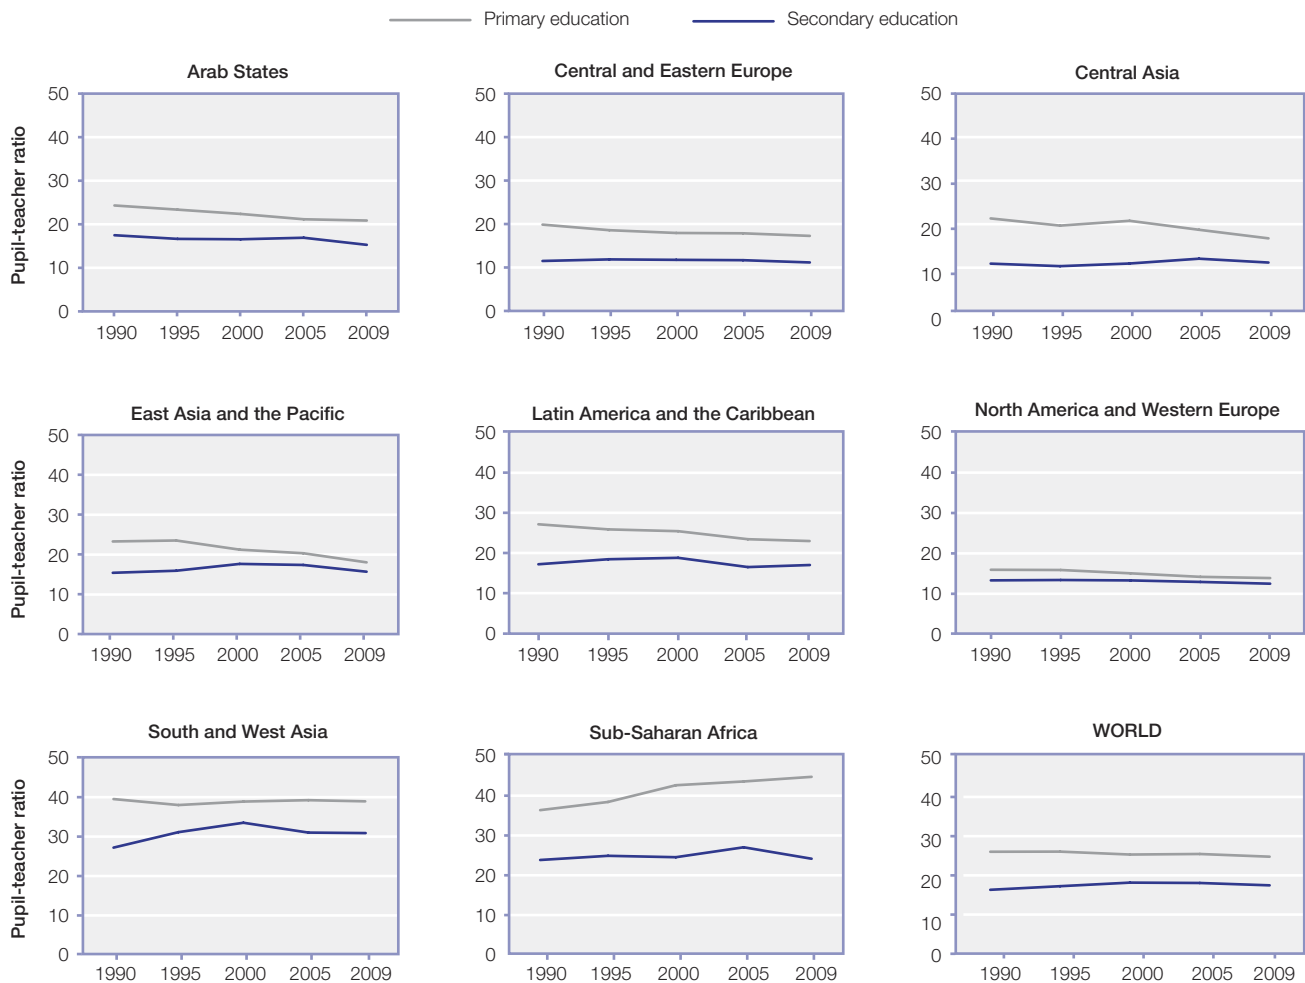

**Primary and secondary pupil-teacher ratios and educational quality: Averages do not tell the full story**

The pupil-teacher ratio (PTR) is an important indicator which measures the overall level of teacher deployment and, as such, needs to be considered when evaluating the demand for and supply of teachers. High PTRs may signify an overstretched teaching staff, while low ratios may indicate additional

capacity. It is important to note that PTRs reflect the human resource capacities of education systems but should not be confused with class size, which is the subject of a distinct indicator. **Figure 26** presents trends in regional PTRs for primary and secondary education from 1990 to 2009.

PTRs are lower at the secondary than the primary level in all regions. In 2009, the global PTR for primary education was 25:1, compared to 17:1 for secondary education. This difference is partly due to a more diversified curriculum in secondary education that requires specialised teachers who teach more hours per subject (Mulkeen, 2010).

**FIGURE 26** How have pupil-teacher ratios for primary and secondary education changed since 1990? Pupil-teacher ratios for primary and secondary education by region, 1990-2009

**Note:** South and West Asia: UIS estimates based on data with limited coverage for the reference year, produced for specific analytical purposes.  
**Source:** UNESCO Institute for Statistics database and Statistical Tables 3 and 8.

Between 1990 and 2009, PTRs in primary education remained stable or decreased in all regions except in sub-Saharan Africa, where the PTR increased from 36:1 to 45:1. Countries with the highest PTR increases in this region are Benin (31:1 to 45:1) and Ethiopia (41:1 to 58:1), signifying that they had difficulty in responding to the rising number of primary school pupils. In contrast, Lesotho and Senegal managed to reduce considerably their primary PTRs, from 55:1 to 34:1 and 58:1 to 30:1, respectively. While the primary PTR did not increase in South and West Asia during this period, it remained high, at approximately 39:1.<sup>14</sup>

During this period, PTRs in secondary schools remained stable for all regions except South and West Asia, where the ratio increased slightly. With a current ratio of 31:1, the region has the highest PTR for secondary education, and Nepal has the highest PTR in the region (40:1).<sup>15</sup> In Sri Lanka, however, there are only 20 pupils per teacher, which is the lowest PTR at secondary level in the region.

14 South and West Asia: UIS estimate based on data with limited coverage for the reference year, produced for specific analytical purposes.  
15 Ibid.

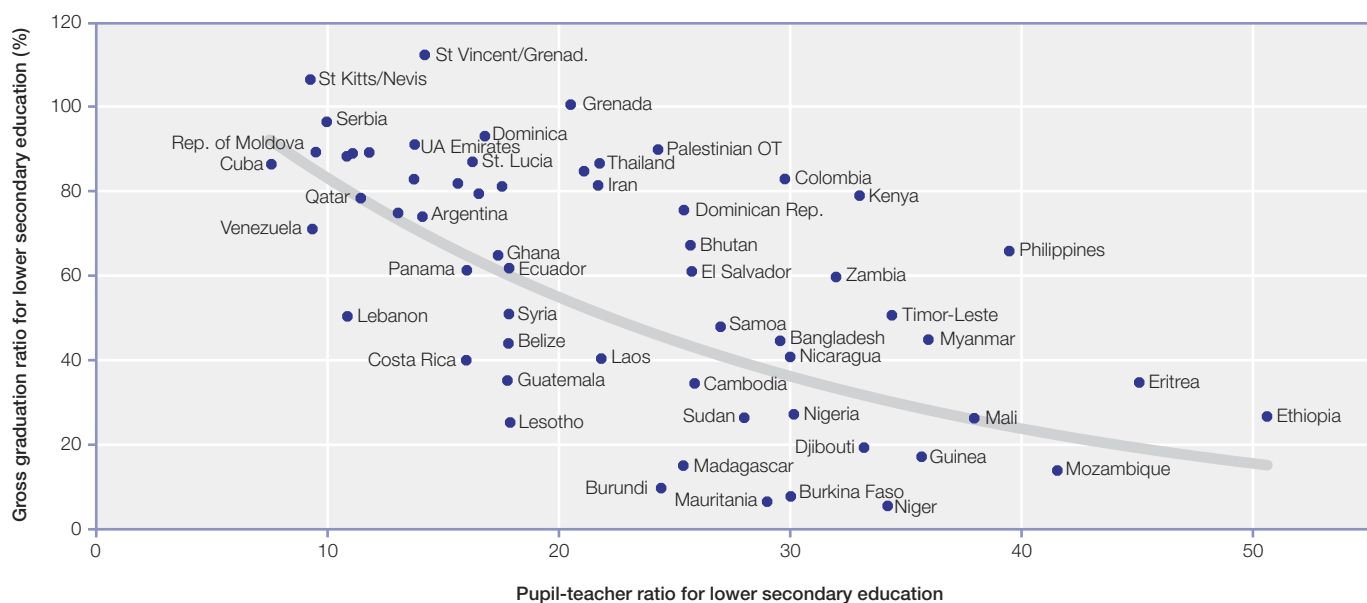

Three regions have by far the lowest PTRs in secondary education: Central and Eastern Europe (11:1), Central Asia (11:1), and North America and Western Europe (12:1). These ratios have been relatively stable for the past two decades.

The PTR is often treated as a proxy for measuring educational quality. For instance, it can generally be stated that the higher the PTR, the less contact there is between teachers and their students. For a variety of children, this may have consequences which go further than just poor quality instruction. High PTRs can contribute to the risk of grade repetition or dropout among students.

Figure 27 shows the relationship between lower secondary PTRs as a proxy measure of quality of education and gross graduation ratios as a measure of educational output. It demonstrates that countries with higher PTRs at the lower secondary level also tend to have lower graduation ratios at this level. For example, in the vast majority of countries with a PTR below 15:1, the gross graduation ratio is approximately 70% or higher. In contrast, the gross

**FIGURE 27**

**How do pupil-teacher ratios relate to the completion of lower secondary education?**  
**Relationship between lower secondary pupil-teacher ratios and gross graduation ratios in lower secondary education, 2009 or most recent data**

Source: UNESCO Institute for Statistics, Statistical Tables 7 and 8.

graduation ratios are below 40% in Afghanistan, Eritrea, Ethiopia and Mozambique, while lower secondary PTRs exceed 40:1.

While there is a relationship between the two variables, a combination of diverse factors can affect graduation. For example, the Philippines (39:1) has a lower secondary PTR that is more than double that of Guatemala (18:1), yet the graduation ratio in the Philippines is 30 percentage points higher than in Guatemala—66% compared to 35%, respectively. Similarly, Kenya has a PTR (33:1) almost twice that of Lesotho (18:1), but Kenya's graduation ratio is more than three times higher than that of Lesotho (79% versus 25%). These cases suggest that in some countries the PTR may not be an appropriate proxy measure for the quality of education.

### Training and qualifications of secondary school teachers vary greatly from one country to another

Given the increasingly complex nature of the subjects taught in secondary education, most countries have policies to ensure that teachers at this level have higher qualifications than their primary school counterparts. Globally, primary school teachers show substantial variability between and within regions regarding the minimum required level of training, which ranges from secondary- to tertiary-level qualifications. In the majority of countries with data, lower secondary teachers must have a post-secondary non-tertiary (ISCED 4) or tertiary-level (ISCED 5) qualification, while upper secondary teachers are almost universally required to have a tertiary level (ISCED 5) accreditation (UIS, 2006). For more detailed information on teaching qualifications, please see **Box 10** on the taxonomy

#### **BOX 10. Taxonomy of pre-service teacher training programmes and the proposal for new UIS indicators**

The 'percentage of trained teachers' indicator is used to measure the quality of the teacher workforce. However, given the wide variety of teacher training programmes available globally, this indicator does not readily permit for international comparability. For instance, national standards for training primary school teachers in some countries may require completion of a two-year teacher training programme at the upper secondary level (i.e. ISCED 3), whereas in other countries, a primary school teacher must complete four years of training in a tertiary-level institution (i.e. ISCED 5) after completing secondary education.

Furthermore, some teachers hold a tertiary-level (ISCED 5) qualification without having completed a programme specifically in pedagogy. In some countries, these teachers would be considered untrained. Given the differences in teacher training strategies across countries, the information from the 'percentage of trained teachers' indicator does not constitute internationally comparable data. At best, this indicator provides a useful measure of how well countries are able to meet their own standards and norms for training teachers. As such, it needs to be complemented with other data on teacher qualifications.

In order to take into account the complexity of teacher training programmes, the UIS has proposed a new taxonomy to categorise global teacher training programmes based on various quality-related criteria. The first step entails classifying teacher training programmes according to ISCED on the basis of programme content, entry prerequisites and programme duration. This information can complement the 'percentage of trained teachers' data, which indicate whether or not teachers have completed a nationally accredited teacher training programme and earned an official teaching qualification. In addition to the data on the percentage of trained teachers, data could be collected on the number of teachers per ISCED level completed (i.e. ISCED 2-6). This data collection strategy on teacher qualifications and training will allow for much needed international comparability on teacher quality. New indicators could include:

- Percentage of teachers with ISCED 5A and/or 5B;
- Percentage of teachers with ISCED 4 and/or 3; and
- Percentage of teachers with ISCED 2 or less.

of pre-service teacher training programmes and the proposal to collect data on the number of teachers trained at various ISCED levels.

**Figure 28** shows the proportion of teachers holding different qualifications for primary, lower secondary and upper secondary levels of education in ten middle-income countries which are participating (or have previously participated) in the World Education Indicators (WEI) programme.

In Brazil, China, Indonesia and Sri Lanka, the proportion of teachers who hold a tertiary-level (ISCED 5 or 6) qualification increases as the education level at which they teach rises. In China, for instance, approximately 98% and 97% of lower and upper secondary teachers, respectively, hold a tertiary-level qualification (i.e. ISCED 5). This is in contrast to primary school teachers, of which 71% hold a tertiary-level qualification and 28% an upper secondary-level qualification. The situation is similar in Indonesia, where approximately two-thirds of primary school teachers hold tertiary-level qualifications versus 100% of all lower and upper secondary teachers.

In some countries, teacher candidates complete labour market-oriented tertiary-level training programmes (i.e. ISCED 5B) that provide practical teaching skills, while others complete more theoretical tertiary-level programmes (i.e. ISCED 5A) that are intended to provide sufficient qualifications for gaining entry into professions with high skills requirements or advanced research programmes. Given the more complex subject matter of secondary education, ISCED 5A programmes are more commonly required to teach at that level. For example, in Indonesia, data show that among primary school teachers, about one-half (51%) have an ISCED 5B qualification, compared to about 23% who have an ISCED 5A qualification. By the secondary level, however, this trend is reversed. Among lower and upper secondary teachers, 73% and 84%, respectively, hold an ISCED 5A qualification while the minority holds an ISCED 5B qualification. In upper secondary education, 6% of

the teachers hold an advanced research degree (e.g. a doctoral degree). A similar pattern is observed in Malaysia.

In Jamaica and Jordan, there is little correlation between the teaching level (i.e. primary to upper secondary) and the proportion of teachers with a tertiary-level qualification. In fact, almost all primary- and secondary-level teachers have tertiary-level qualifications, demonstrating that these two countries are well equipped to train and recruit teachers with high qualifications.

This is not the case for other countries shown in Figure 28. For example, in Sri Lanka, only 56% of upper secondary teachers hold tertiary-level (ISCED 5A) qualifications. Given the lack of qualified teachers, Sri Lanka recruits many upper secondary school teachers with qualifications no higher than the level they will teach, which raises questions about whether teachers can meet their students' learning needs. Brazil is also challenged in the training and recruitment of sufficient numbers of qualified teachers in secondary education. In that country, 84% and 93% of lower and upper secondary teachers, respectively, have tertiary-level qualifications (ISCED 5).

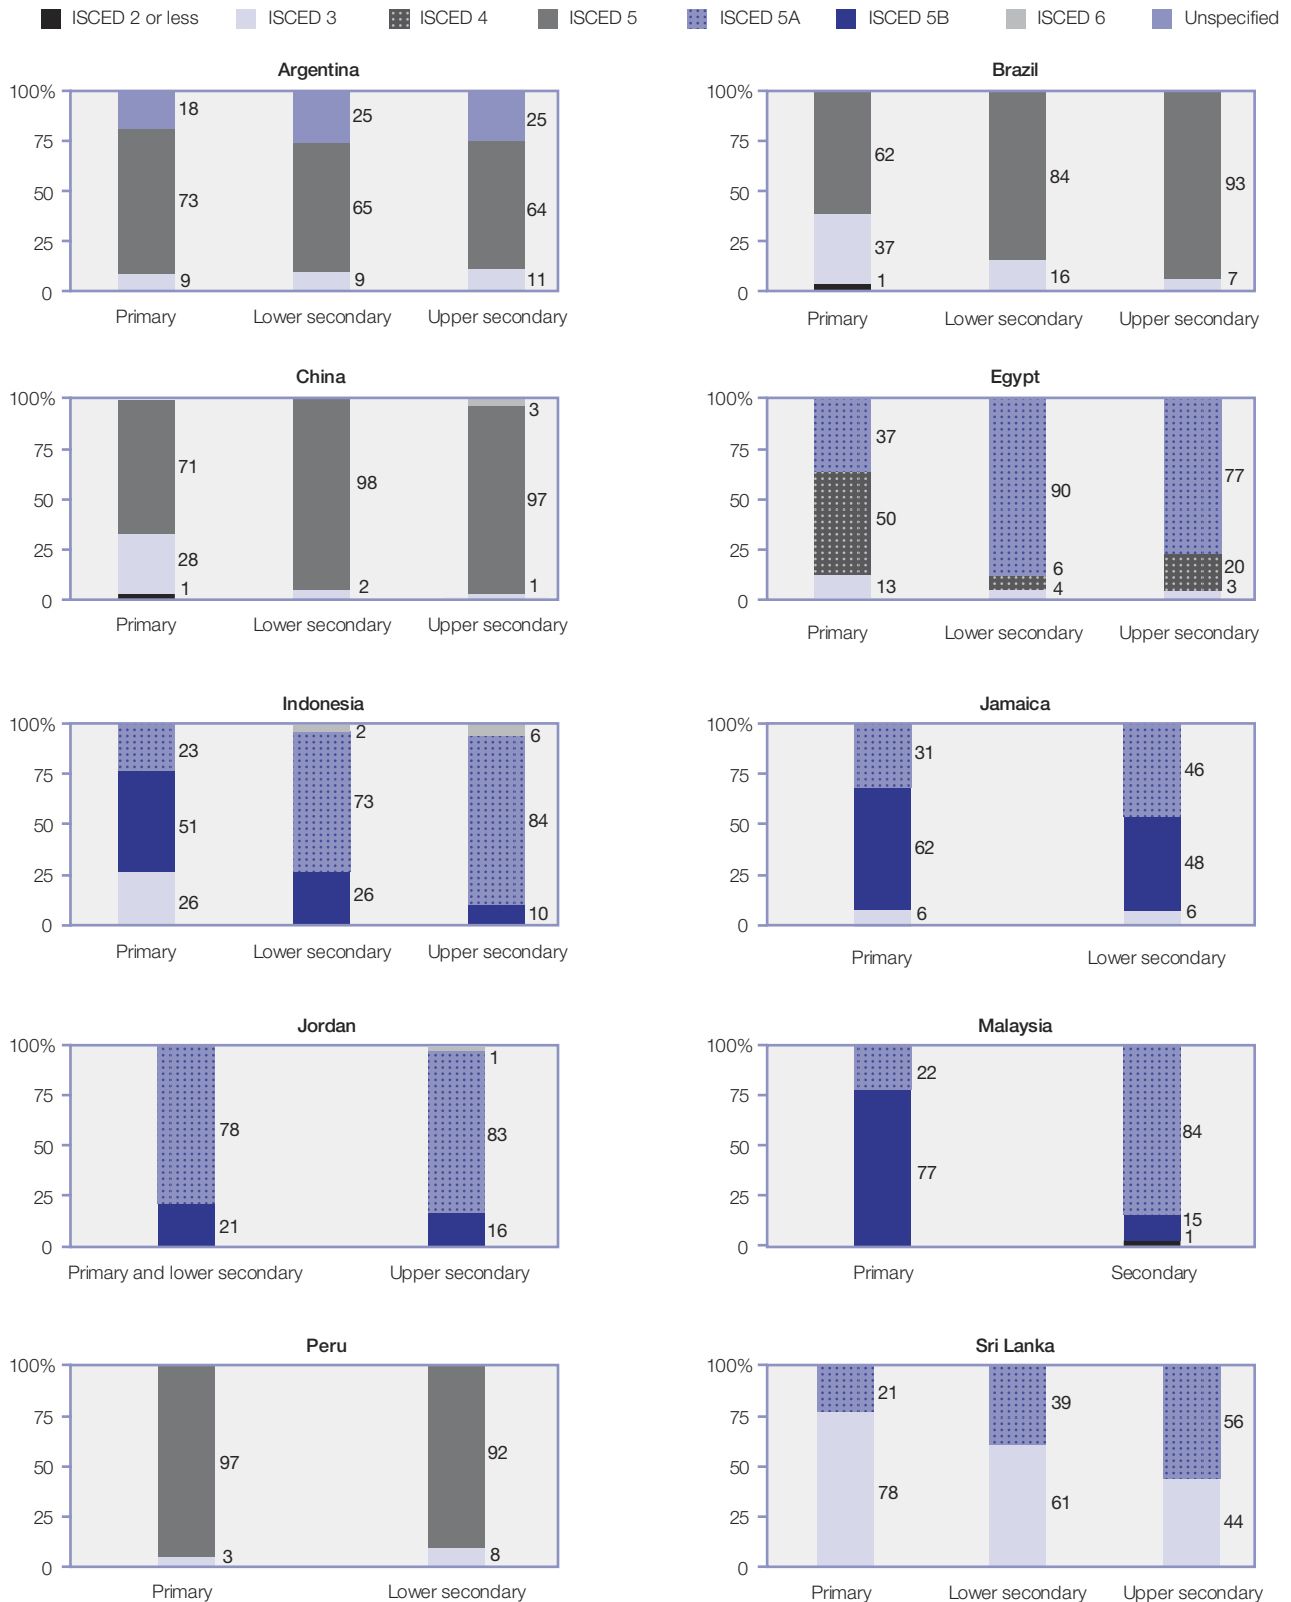

Egypt provides an interesting example in that the proportion of teachers with a tertiary-level qualification decreases from lower to upper secondary levels. This can be explained by the increasing role of technical and vocational education at the upper secondary level, delivered by teachers with post-secondary non-tertiary level (ISCED 4) qualifications.

### **Intended instruction time: Only the share allocated to mathematics is similar across countries**

Intended instruction time is an important educational resource defined as the number of hours during the school year that students are expected to be taught both compulsory and optional subjects. While this indicator measures the quantity of education a student receives, it also

**FIGURE 28**

**Do secondary school teachers have higher qualifications than primary school teachers?**  
**Percentage of teachers holding different qualifications by education level, 2008**

**Note:** Data for Brazil refer to 2007.  
**Source:** UNESCO Institute for Statistics database.

provides insight into educational quality, assuming that a minimum level of instruction is required for students to learn, particularly in certain subject matter areas (see **Box 11**).

Intended instruction time accounts for a large part of public spending on student learning; as such, increasing instruction time may entail an increase in financial costs by hiring more teachers or by compensating existing teachers to teach longer hours. On the other hand, policymakers may decide to increase instruction time by raising the number of working hours of existing teachers with no concurrent raise in remuneration. While this policy may be intended to improve education for students, it could also lead to a decrease in the quality of teaching if teachers have less time to prepare lessons.

Official school regulations usually define statutory requirements regarding hours of instruction and set up the minimum annual instruction time that schools must offer. Schools, however, may fail to meet these standards for different reasons, such as insufficient numbers of trained teachers, teacher absenteeism and strikes, natural disasters and a number of other factors (Benavot, 2004). Moreover, in many countries instruction time varies substantially between regions and types of schools (OECD, 2010a).

Annual instruction time generally rises with the education level, because the number of subjects and the teaching hours per subject also increase.

**Figure 30** presents the cumulative number of hours of instruction an adolescent can expect to receive at ages 12-14 years in high- and middle-income countries with available data. This age group corresponds typically to lower secondary education (or ISCED 2) in the majority of countries.

In this selected group of countries, students are expected to receive, on average, 2,779 hours of instruction between the ages of 12 and 14 years. However, this mean hides differences between countries. For example, intended cumulative

instruction time is relatively low in Poland (1,933 hours), Indonesia (2,085 hours), Sweden (2,222 hours) and Slovenia (2,374 hours), while it is relatively high in Mexico (3,500 hours), Jordan (3,679 hours), Malaysia (3,690 hours) and the Philippines (4,400 hours).

Although data on instruction time are difficult to compare across countries because of differences in national and curriculum priorities, the amount of instruction time and its allocation between compulsory subjects are good indications of public spending on different types of learning opportunities.

**Figure 31** shows instruction time per compulsory subject as a percentage of total compulsory instruction time for 12- to 14-year-olds in the same group of high- and middle-income countries. In this group of countries, an average of 55% of compulsory instruction time is allocated to four subjects: reading and writing (16%), mathematics (13%), science (13%) and modern foreign languages (13%). The remaining 45% of total intended instruction time is devoted to other compulsory subjects, of which physical education and the arts are allocated the most hours (8%-9%).

The biggest variation is observed for modern foreign languages, where the share of instruction time ranges from 5% in Jamaica to 26% in Luxembourg. Benavot (2004) showed that during the last 25 years, a growing number of countries require students to learn modern foreign languages.

There are also important variations across countries regarding the share of compulsory instruction time devoted to reading and writing, and science. For reading and writing, this share ranges from 11% in Japan and Portugal to 28% in Ireland, and for science it varies from 5% in Luxembourg to 24% in the Russian Federation. The low share of compulsory instruction time devoted to science in Luxembourg may be explained by the greater priority this country gives to modern foreign languages (26%); conversely, the priority given to teaching science in the Russian Federation coincides with a relatively low focus on

**BOX 11. Understanding inequities in learning outcomes**

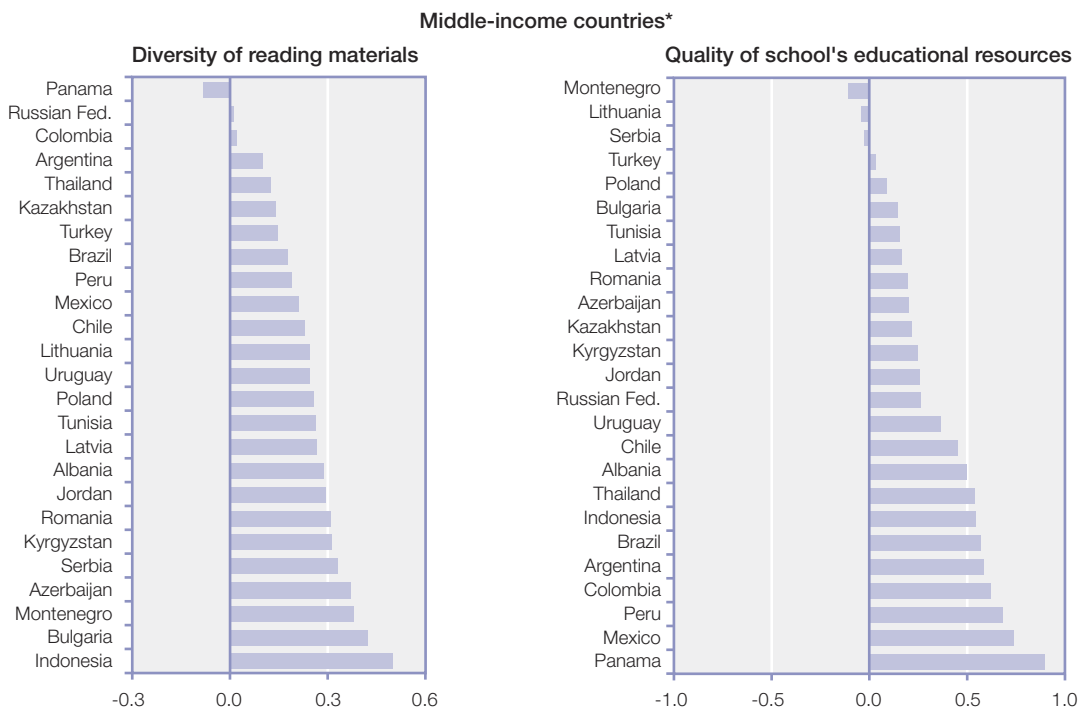

With the global expansion of primary and secondary education, there is growing concern about the low quality in learning outcomes. Both national and cross-national studies have shown that low levels of learning achievement in school subjects exist in school systems in both developing and developed countries, although they are much more widespread in the former (Mullis et al, 2008; OECD, 2010a). Low levels of academic achievement tend to be much more prevalent among students from relatively disadvantaged family backgrounds, regardless of the national level of achievement (OECD 2010b; Willms, 2006).

Overall, high-performing students, regardless of their family backgrounds, tend to have common characteristics. Such characteristics concern the students as learners, as well as their learning experiences both at home and in school. For instance, both national and international studies have pointed out that successful students tend to be motivated and confident learners, have the necessary support in their home environment, spend an adequate amount of time on challenging tasks, and attend schools with a positive disciplinary climate and sufficient resources (OECD, 2010b, 2010c, 2010d, 2011b; Willms, 2003, 2006).

Data from the OECD Programme for International Student Assessment (PISA) 2009 highlight a range of disparities which should be addressed in policies and programmes aiming to reduce gaps in learning outcomes in reading. PISA 2009, which covers 34 OECD countries and 31 partner countries and economies of OECD, reported that reading performance of 15-year-olds is associated with their socio-economic backgrounds in all countries. With few exceptions, students from disadvantaged family backgrounds (those in the bottom one-third of the national scale of the family economic, social and cultural status index) reported to read much less diverse materials than those from relatively advantaged backgrounds. A significant number of students from middle-income countries reported much less diversity in their reading materials.

Also, PISA 2009 examines the deficits in the school experience of students from relatively disadvantaged backgrounds. For example, these students tend to go to schools that have lower quality educational resources (see Figure 29). These findings can be used to better identify ways to improve the learning achievements of students from disadvantaged family backgrounds in the context of each country. They can also be used to promote greater understanding, discussions among stakeholders and relevant research (Kellaghan et al, 2009).

**FIGURE 29** What affects reading achievement of students from disadvantaged and advantaged family backgrounds?  
Differences in the mean values of two reading achievement indicators for students from advantaged and disadvantaged backgrounds in middle- and high-income countries

continued...

**BOX 11. ...continued**

**Note:** The bars indicate the difference in the mean values of the indicators between students from advantaged and disadvantaged backgrounds, adjusted by the standard deviation of the respective indices, i.e. effective size (Cohen, 1988). The indices were constructed in such a way that a greater value represents a more desirable situation (e.g. more diversity of reading materials and higher quality educational resources at school). Thus, positive values of the differences represent a deficit for students from the disadvantaged backgrounds, and vice versa.

the instruction of modern foreign languages (9%) and other compulsory subjects (38%).

The subject with least variation amongst countries is mathematics, suggesting a relatively uniform level of priority among countries. The share of time devoted to this subject only varies from 10% in Japan to 16% in Argentina. Benavot (2004) has shown that the share of time devoted to mathematics as a proportion of total compulsory instruction time declines slightly as pupils move from primary to lower secondary education.

**Secondary school teachers and remuneration: Salaries tend to be higher than for primary school teachers**

In the majority of countries, more than 50% of total education expenditure allocated to public institutions is spent on staff salaries (with teachers accounting for the largest share). In developing countries, the percentage spent on staff salaries is typically even higher, often making up more than 80% of total public expenditure on education. Given the high proportion of overall education budgets spent on

FIGURE 30

teachers' salaries, there are significant constraints to hiring additional teachers, particularly in many developing countries where infrastructure is often weak and in need of improvement. On the other hand, offering higher salaries to teachers may attract better qualified candidates to the profession (Mulkeen et al., 2007).

Figure 32 shows a partial link between countries' economic conditions and teacher remuneration. For instance, in several low-income countries in sub-Saharan Africa, where teacher salaries are typically several times higher than the GDP per capita, secondary school teachers are compensated at a much higher rate than their primary-level counterparts. Lower and upper secondary teachers in Rwanda earn 6 and 7 times the GDP per capita, respectively, whereas primary teachers earn 2.6 times the GDP per capita. Secondary school teachers in Burkina Faso, Burundi, the Central African Republic, Madagascar, Malawi and Togo also earn substantially higher salaries than primary school teachers.

In contrast, there are some exceptions, such as Liberia and the United Republic of Tanzania, where teachers at all education levels earn approximately the same salaries. While teachers' salaries may seem competitive, in particular at the secondary level, they have in fact been declining relative to GDP per capita since 1975 in sub-Saharan Africa (Pôle de Dakar, 2009).

Among 11 middle-income countries, the differences in salaries for primary and secondary school teachers are less pronounced. In fact, in Argentina, Chile, Egypt, Jordan, Peru, the Philippines and Sri Lanka, these differences are almost negligible. On the other hand, secondary school teachers (both lower and upper) in Tunisia and Paraguay earn approximately twice the GDP per capita, while teachers at the primary level earn less, around 1.73 and 1.6 times the GDP per capita, respectively. Relative to GDP, teachers' salaries (for primary, and lower and upper secondary education) are highest in Cape Verde and lowest in Indonesia, which may face a significant

challenge in attracting the most qualified candidates to the profession.

In most high-income countries, teachers' salaries are comparable to GDP per capita. In some cases, however, they can be considerably higher, as in the Republic of Korea (2.11 times the GDP per capita). Moreover, for the most part, salary differences between primary and secondary school teachers are negligible in this group of countries.

In North America and Western Europe, and in Central and Eastern Europe, teachers' salaries for all

education levels tend to be in the average GDP per capita range. However, some high-income countries pay their secondary teachers more than their primary-level counterparts. This is particularly true of Luxembourg, where lower and upper secondary teachers earn 50% more relative to the GDP per capita. This is also true of Germany, the Netherlands and Spain, even though the differences in teacher remuneration between primary and secondary education are smaller. In some countries, such as Belgium, teachers only start receiving higher salaries at the upper secondary level.

## FINANCING SECONDARY EDUCATION: CURRENT CONDITIONS, COST STRUCTURES AND POLICY ACTIONS

Governments with limited resources must strike a balance when financing primary, secondary and tertiary education. The drive to provide free UPE has led to a rising demand for secondary education. However, extensive resources are required to provide quality secondary education to increasing numbers of young people. At the same time, governments must consider financing for tertiary education so that an adequate number of teachers and other professionals can be trained to support the expansion of education and provide opportunities for students aspiring to further their skills and knowledge.

Evidence shows that many developing countries will continue to face severe problems in financing the expansion of their secondary education systems if present conditions and cost structures do not change (Lewin, 2008; UNESCO-IIEP, 2010; World Bank, 2005). Many governments are unable to mobilise sufficient domestic resources, while others rely heavily on external financing.

This section discusses the financial challenges faced by developing countries seeking to expand their secondary education systems. The discussion begins with a global perspective on national commitment to secondary education before examining the unit costs, which tend to be relatively high in many developing countries. These financial shortfalls are evident in the high contributions that households make to pay for secondary education. The conclusion presents a series of policy options that could be considered in efforts to expand this level of education.

### **Commitment and investment by governments in secondary education**

A common way to gauge a government's commitment to education is to compare public

expenditure on education with the gross domestic product (GDP). As illustrated in **Figure 33**, the world average of total public expenditure on all levels of education in 2009 totalled 4.8% of GDP.<sup>16</sup> Public spending on education as a share of GDP was highest in North America and Western Europe (5.2%), followed by Central and Eastern Europe (5.0%) and sub-Saharan Africa (4.9%). The regions of Latin America and the Caribbean, as well as South and West Asia, are close to the world average, with 4.8% and 4.7% respectively. The lowest public share of national resources in education is found in Central Asia, with an average of 3.6%.

Globally, public spending on primary and secondary levels of education as a share of GDP is equally distributed. Public expenditure for secondary education accounted for 1.6% of the world's GDP in 2009, while primary and tertiary education attracted 1.7% and 1.0%, respectively. However, the situation varies considerably between and within the different regions.

From a regional perspective, sub-Saharan Africa and East Asia and the Pacific devote the lowest shares of GDP to secondary education (1.3%), followed by the Arab States and Latin America and the Caribbean, with 1.5%. At the national level, public spending on this education level falls even further in many countries, such as Central African Republic, Dominican Republic, Guatemala, Guinea, Liberia, Swaziland and Zambia, which invest less than 0.5% of GDP in their secondary education systems.

These low levels of investment are not simply due to a lack of government commitment but also to very weak and limited domestic tax bases in many

<sup>16</sup> Averages reported in this discussion are based on selected countries with available data. Please refer to the notes below each figure for more details on data coverage.

**FIGURE 33**
**How do governments allocate spending on education?**
**Public expenditure by education level as a percentage of GDP, selected countries, by region, 2009**

**Notes:** "Other" includes expenditure for pre-primary education and unallocated expenditure. World and regional averages are calculated based on 145 countries with available data over the period 2007-2009, representing 83% of the world's total GDP in PPP\$. Number of countries covered by region: North America and Western Europe (24/29), Central and Eastern Europe (16/21), Sub-Saharan Africa (35/45), Latin America and the Caribbean (25/42), South and West Asia (7/9), East Asia and the Pacific (17/34), Arab States (14/20), and Central Asia (7/9).

**Source:** Public expenditure on education: UNESCO Institute for Statistics database and Statistical Table 15; GDP: World Bank.

developing countries. In addition, a government's investment in education is determined by a number of other factors, such as the size of the primary and secondary school-age populations, national educational priorities, and competing funding priorities from other social sectors, like health.

### Assessing the public costs associated with secondary education

Expanding access to secondary education is often constrained by relatively high costs that governments must bear per student. Some existing studies point out that substantial expansion of access to secondary education will not be attainable in many developing countries without bold cost-saving reforms (Lewin and Caillods, 2001; UNESCO-IIEP, 2011). To better evaluate the extent to which

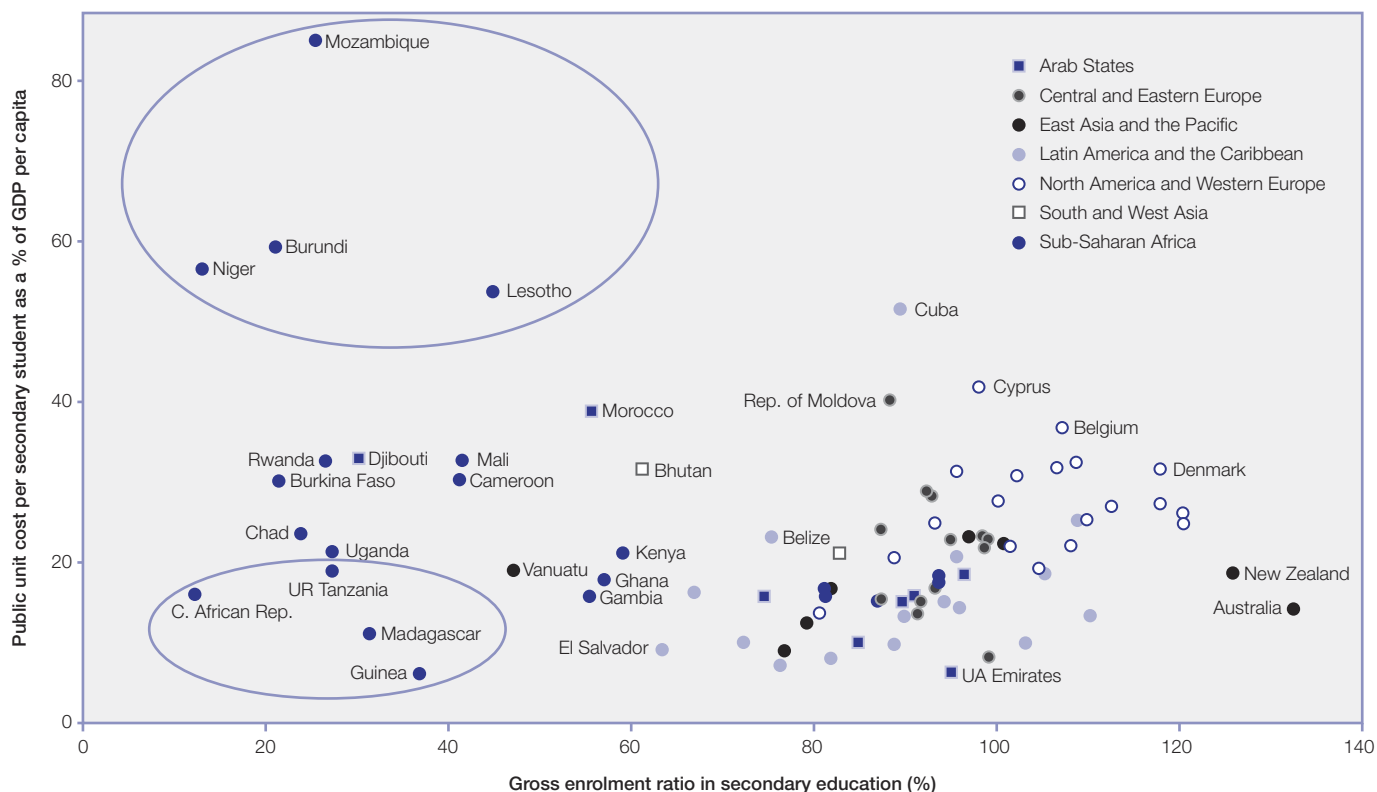

countries which are most in need can expand their secondary education systems, it is useful to consider public expenditure per secondary school student as a ratio of GDP per capita.

**Figure 34** presents the public unit cost per secondary school student (as a percentage of GDP per capita) in relation to secondary GER. For countries with higher GERs in secondary education, the unit cost per student is, with a few exceptions, relatively lower. Most are middle- or high-income countries. On the other hand, unit costs vary considerably among countries with low secondary GERs, most of which are located in sub-Saharan Africa. Some African countries with low GERs show extremely high unit costs per secondary school student, such as Lesotho (54% of GDP per capita), Niger (57%), Burundi (60%) and Mozambique (85%).

FIGURE 34

## How do student unit costs compare to enrolment levels?

Government expenditure per secondary school student (as percentage of GDP per capita) in relation to secondary gross enrolment ratio, in selected countries, 2009

Note: Most recent data available within the period 2006-2010 are used.

Source: Public expenditure on education and gross enrolment ratio: UNESCO Institute for Statistics database and Statistical Table 15; GDP: World Bank.

For these countries, the first priority will be to reduce these costs in order to expand participation in this level of education.

A very different situation is found in other countries of the region. Central African Republic, Guinea and Madagascar report low figures, both for the GER and the public unit cost per secondary school student relative to average income. These countries may, therefore, be in a position to mobilise additional public funding for secondary education.

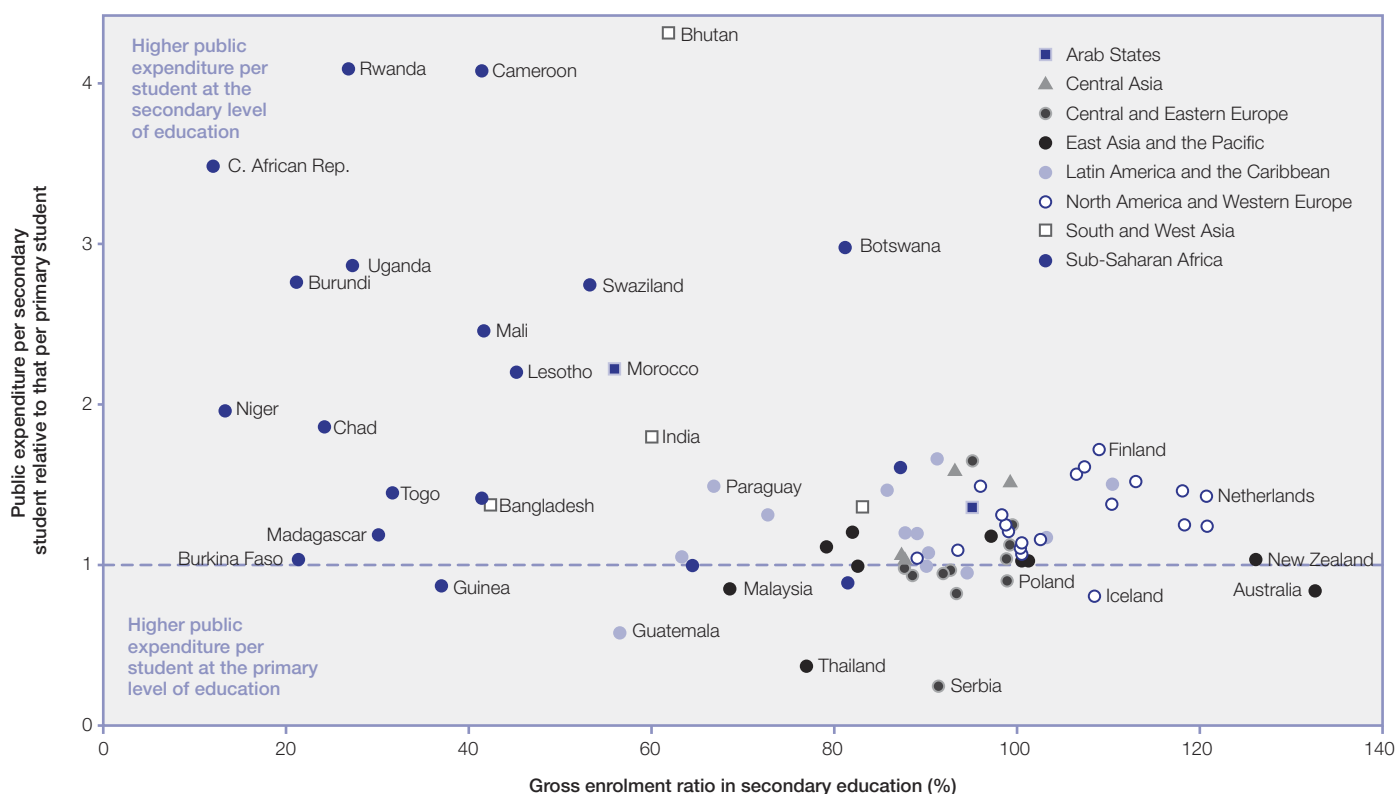

How do these unit costs compare with other levels of education? Are countries spending more on primary or secondary students? **Figure 35** compares unit costs for primary and secondary education. In general, countries spend one to two times more on a secondary school student than a primary school pupil.

This is evident in Central and Eastern Europe, North America and Western Europe, and Latin America and the Caribbean. However, several sub-Saharan African countries show a different pattern. Some countries with lower secondary GERs, such as Cameroon, Central African Republic and Rwanda, show extremely high unit costs for secondary education compared to primary education. This constitutes a serious barrier to secondary school expansion, which is needed to meet growing demand in the region.

There are several possible reasons for the elevated costs associated with secondary education. In some countries, secondary schools are geographically far from students' homes, which entails additional costs for transportation or provision of room and boarding. In general, secondary school teachers must have higher academic qualifications and, thus,

**FIGURE 35**

**Are unit costs higher for secondary school students than for primary school pupils?  
Expenditure per secondary school student versus expenditure per primary school pupil, in selected countries, 2009**

**Note:** Most recent data available within the period 2006-2010 are used.  
**Source:** Public expenditure on education and gross enrolment ratio: UNESCO Institute for Statistics database and Statistical Table 15; GDP: World Bank.

receive higher salaries than primary school teachers. In many low-income countries, such as Malawi, Madagascar, Niger and Rwanda, a secondary school teacher earns two to four times more than a primary school teacher (Pôle de Dakar database). Overall, public spending on secondary education may vary considerably, depending on the cost-sharing mechanisms that are in place, such as contributions by households and other private entities.

**Private financing of secondary education: A heavy burden, especially on poor families, as pressures to expand increase**

Although many countries have instituted school fee abolition programmes to make primary education free for all, households in many regions of the world still shoulder a relatively heavy burden in financing

secondary education. Household spending is still widely needed to supplement public expenditure on secondary education and remains an essential source of funding for educational development in some regions of the world.

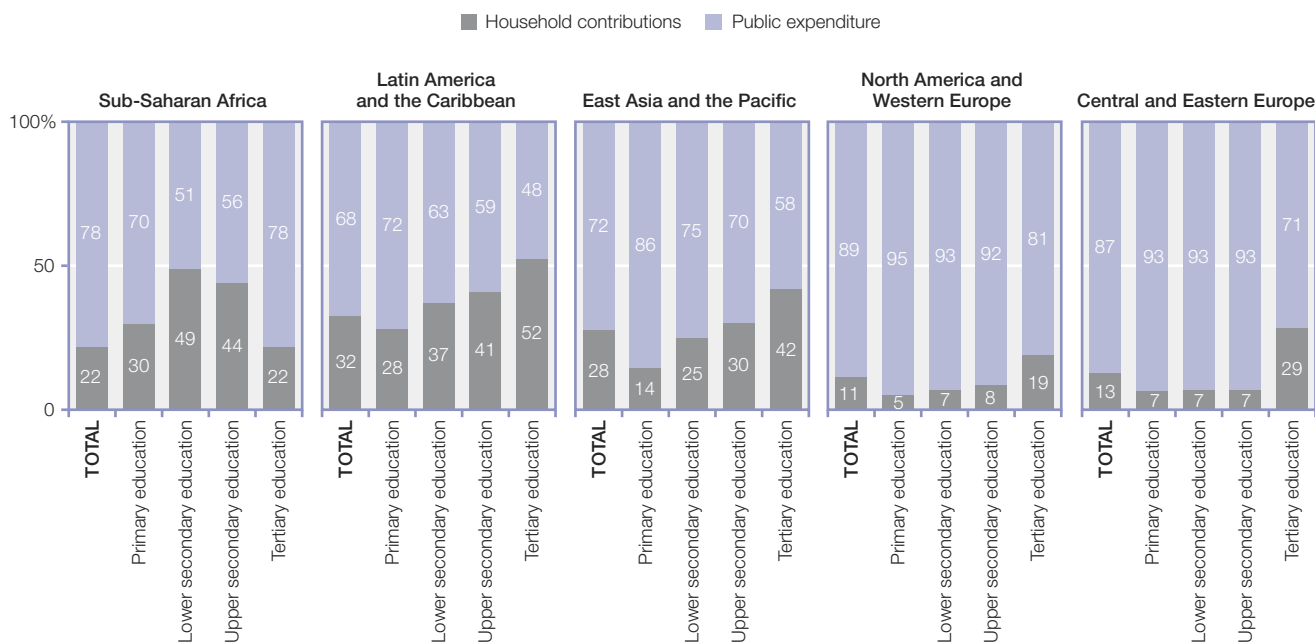

**Figure 36** compares average contributions to education financing from public and household sources in five regions. On average, the share of household contributions to education costs is, in fact, the highest in sub-Saharan Africa, where households contribute up to 49% and 44% of total expenditure for lower and upper secondary education, respectively, as opposed to 30% and 22% for primary and tertiary levels, respectively.

High household contributions in secondary education financing are also found in Latin America and the

FIGURE 36

## How much do households contribute to secondary education?

Household expenditure on education as percentage of total education expenditure, by level of education, selected countries by region, 2003-2009

Notes: Averages are based on simple averages of selected countries with available data for the period 2003-2010.

Number of countries covered by region: Sub-Saharan Africa (16/45), Latin America and the Caribbean (12/42), East Asia and the Pacific (5/34), North America and Western Europe (20/29), and Central and Eastern Europe (11/21).

Regions are arranged in order of their household contributions to the cost of secondary education financing.

Source: Sub-Saharan African countries: Pôle de Dakar database; all other regions: UNESCO Institute for Statistics database.

Caribbean, as well as in East Asia and the Pacific, where household contributions range from 25% to 41% of total expenditure for secondary education. In contrast, household contributions are relatively low in North America and Western Europe, as well as in Central and Eastern Europe, where contributions from students' families account for 7% to 8% of total expenditure on education.

The high cost of secondary education for households, as observed in several developing countries, has a negative impact on students from poor families. These households are less likely to be able to bear the costs of secondary school, such as enrolment fees, textbooks, etc. Section 1.6 also indicated that household wealth is associated with participation in lower secondary education. In addition, opportunity costs are higher for secondary school-age adolescents than for primary school-age children, since the former have greater working and

earning potential; this has a further negative impact on secondary school enrolment.<sup>17</sup>

National patterns in household spending on secondary education are shaped by a number of inter-related factors. In many countries, primary education is provided free of charge and tertiary students are highly subsidised by public funding. Secondary education is a crucial intermediate stage between these two levels of education. The equitable spending of public resources across all education levels is therefore a key policy issue.

### Policy options to increase investments in secondary education

Commitments to provide UPE to all primary school-age children have started to bear fruit. However,

<sup>17</sup> A recent UIS report on financing education in sub-Saharan Africa provides an in-depth analysis of education in developing countries: [www.uis.unesco.org/publications/finance](http://www.uis.unesco.org/publications/finance)

as more and more children are completing primary education, intense pressure is being felt at the lower and upper secondary levels to accommodate the growing demand for further educational opportunities.

In light of domestic budget constraints in many developing countries, coupled with the financial crisis in many donor countries, there is an urgent need for bold, innovative and sustainable strategies to reinforce the financing of secondary education. The following suggestions are possible policy routes for countries seeking to expand this level of education.<sup>18</sup>

Increasing public expenditure for secondary education is needed in low-income countries, especially in sub-Saharan Africa, where the secondary GER is extremely low and public financing for this level is insufficient. Additional resource mobilisation for secondary education is necessary and could be achieved in two ways: i) finding new sources of financing; and ii) reallocating funding from primary and tertiary levels to the secondary level. While the ability to allocate new funding to secondary education could be constrained by weak tax bases and will certainly depend on the overall macroeconomic environment, intra-sector reallocation will depend on whether primary education is already at or near universal access, in which case heavy investments are no longer needed at that level.<sup>19</sup> Moreover, the amounts likely to be released from the tertiary level would be marginal relative to the massive investments required for secondary education expansion.

<sup>18</sup> Lewin (2008) provides a comprehensive range of relevant and affordable options that could guide governments seeking to finance the expansion of secondary education.

<sup>19</sup> Rwanda has been increasingly reducing the education budget share allocated to higher education. Initially, this reallocation financed primary education needs and neglected secondary education. Since 2008, attention has shifted towards secondary education. For more details, see Uyttensprot (2008).

Furthermore, there is a need to re-examine unit costs at the secondary level. A number of countries with low secondary GERs, especially those in sub-Saharan Africa, clearly show relatively high unit costs per secondary pupil. For such countries, participation in secondary education could be increased by reducing unit costs. The following options could be considered, depending on the country context: i) reducing the price of inputs (teachers, books and school construction); ii) increasing internal efficiency (lowering repetition and dropout rates); and iii) developing cost-sharing mechanisms (such as increasing private contributions to finance the cost of secondary education). Approaches for reducing the cost of inputs have been more or less successfully implemented at the primary level, and countries should investigate to see if these can also be applied to expand secondary education. For example, some countries successfully implemented strict procurement procedures in order to reduce the risk of inflated costs associated with school construction and even the provision of textbooks (Lewin, 2008).

Perhaps most importantly, all of these efforts will likely be bound to fail if the education sector, and governments at large, lack efficacy in managing their public finances. Several field studies carried out in developing regions, such as the World Bank's public expenditure tracking survey, have shown that merely allocating public resources may not lead to desired outcomes without sound management of public finances (Rajkumar and Swaroop, 2008).<sup>20</sup> Cost reduction measures and additional allocations to secondary education should be accompanied by strategies to ensure that available funds are effectively spent at the proper destination and used for appropriate goods and services.

<sup>20</sup> For more information on the public expenditure tracking survey, see: <http://go.worldbank.org/84C1RUHTD0>.

## CONCLUSIONS

### Key findings

The secondary level is a crucial stage in the education system for the social and economic development of a country. The demand for secondary education has been increasing worldwide as more countries achieve UPE. The knowledge, attitudes and skills that young people acquire through secondary education are important for their future as productive and healthy citizens of their countries. Today, more countries need a sophisticated labour force equipped with competencies and skills that cannot be acquired through primary education alone. Moreover, workers who have completed upper secondary education earn more than those with less education (UIS, 2005b; UIS and OECD, 2003; World Bank, 2005).

This report examines current issues in secondary education globally, using data and indicators from the school year ending in 2009. The number of children enrolled in primary education has increased globally due to the efforts made by countries and the international community to meet internationally agreed upon goals, including the EFA Dakar Framework for Action and the United Nations Millennium Declaration. The total number of children of official primary school age who are enrolled in primary or secondary education, expressed as a percentage of the corresponding population, increased from 84% to 90% between 1999 and 2009 worldwide.

Regarding completion of primary education, the world average for the gross intake ratio to the last grade of primary indicates that 88% of children will complete primary school in 2009 relative to the total population in age of entering the last grade. Among

162 countries with recent data, girls and boys have equal chances of graduating from primary school in 91 countries. While girls are less likely than boys to complete primary education in 47 countries, boys are less likely to complete it than girls in 24 countries.

A new indicator has been developed by the UIS to reflect the likelihood of a student moving to a higher level of education regardless of repetition. The effective transition rate from primary to lower secondary education is 95% or greater in most countries in Central and Eastern Europe, Central Asia, and North America and Western Europe. On the other hand, many countries in sub-Saharan Africa show low levels of transition from the primary to the lower secondary level: the effective transition rates of 17 out of 30 countries in the region with data were 80% or lower in 2009.

Although participation in secondary education has expanded worldwide since 1999, it is far from universal. The GER in lower secondary education increased from 72% to 80% worldwide between 1999 and 2009, with notable increases in the Arab States (from 72% to 87%) and sub-Saharan Africa (from 28% to 43%). While lower secondary education was compulsory in 80% of all countries with data in 2009, one-third of the world's children live in countries where lower secondary education is formally considered compulsory but where GERs are below 90%.

Upper secondary education is not compulsory in most developing countries. The GERs of upper secondary education in the Arab States (48%), South and West Asia (44%) and sub-Saharan Africa (27%) were far below the world average of 56% in 2009. Enrolment in vocational programmes as a percentage

of total upper secondary enrolment decreased between 1999 and 2009 in many countries, except for those in sub-Saharan Africa. This indicates in part that vocational components have been integrated into general education programmes and that specialised, occupation-specific vocational programmes are becoming less common.

Disparities between young men and women in access to secondary education remain a challenge. Between 1999 and 2009, the female GER increased from 69% to 79% in lower secondary and from 43% to 55% in upper secondary education worldwide. However, Arab States and sub-Saharan Africa still have serious gender disparities at the lower secondary level, and this problem continues at the upper secondary level in South and West Asia and sub-Saharan Africa. Even in countries that have reached gender parity at the aggregate level, data for sub-groups of the population often reveal that gender disparities in school attendance persist, for example among children from rural or poorer households.

Worldwide, the number of teachers in secondary education increased substantially between 1990 and 2009, simultaneously with enrolment in secondary school. Accordingly, student-teacher ratios in secondary education have remained at practically the same level for almost all regions. Teachers in secondary education tend to be compensated at a higher rate than primary school teachers in most of the low-income countries in sub-Saharan Africa that could provide data. In most middle- and high-income countries with data, the difference in remuneration between primary and secondary school teachers is modest or negligible.

While the global population of lower secondary-age children not enrolled in primary or secondary education has fallen significantly, 72 million are still out of school. The highest percentage of lower secondary school-age children out of school was observed in sub-Saharan Africa. Low levels of enrolment among children in this age group are partly explained by the high percentage of children of primary school age who have never entered school.

Of all out-of-school children of primary-school age, 19% left school and 81% have never entered school. One-half of these children are unlikely to ever enter school and 30% are likely to enter school at some point, either at primary or secondary school age.

Regarding public expenditure on education, almost the same percentage relative to GDP was allocated to primary education (1.7%) and secondary education (1.6%) worldwide in 2009. However, there is large variation in the public unit cost per secondary school student in countries with a low secondary GER. In countries with a high GER in secondary education, the unit cost is relatively low, with a few exceptions. In particular, the unit cost per secondary school student is relatively high in several low-income countries in sub-Saharan Africa. Data for 16 countries in this region show that the share of household contributions to education costs is higher at the secondary level than at the primary and tertiary levels.

### Policy implications

Policy measures aimed at mitigating the causes of low transition rates from primary to secondary education need to take into account the growing demand for secondary education. While 95% of primary school graduates continue their education at the lower secondary level in most countries in Central and Eastern Europe, Central Asia, and North America and Western Europe, the transition rate from primary to secondary education remains low in many countries in sub-Saharan Africa. Supply-side interventions, such as increasing or improving the provision of schools and qualified teachers, as well as demand-side interventions, such as improving social and economic conditions of households, could be considered depending on each country's context.

Upper secondary education could also be provided more widely, depending on the social and economic demands of each country. Compared to primary and lower secondary education, access to this higher education level is still limited in all regions, except North America and Western Europe. Human

## CONCLUSIONS

resources with more advanced levels of knowledge and skills are required in many countries, including developing countries, to meet the needs of a knowledge-based economy. The content of upper secondary education should, therefore, be relevant to the demands of the labour market. Furthermore, the provision of upper secondary education should be planned to meet the specific social and economic needs of each country, taking into consideration various issues—such as school location, physical capacity of schools, insertion of vocational components into the curriculum, local labour market demands, and the provision of teachers and instructional equipment.

Out-of-school children and the barriers that prevent their participation in education should be better identified. As primary and lower secondary enrolment rates increase, children who remain out of school may face increasingly complex and compounding disadvantages that prevent their participation in education. Comprehensive profiles of out-of-school children, which identify key personal and household characteristics, as well as past and expected school exposure, can help policymakers to formulate interventions aimed at increasing primary and secondary school enrolment and graduation rates.

## READER'S GUIDE

### The following symbols are used in the statistical tables:

...	No data available
*	National estimation
**	For country data: UIS estimation For regional averages: Partial imputation due to incomplete country coverage (between 33% to 60% of population)
-	Magnitude nil or negligible
.	Not applicable
x(y)	Data are included in column (y) of the table
+n	Data refer to the school or financial year n years after the reference year
-n	Data refer to the school or financial year n years prior to the reference year

### REFERENCE YEAR

The reference year for education and finance data which are presented in the statistical tables is the academic or financial year ending in 2009 or the most recent year available within the period 2007-2008. For a small number of countries, data for 2010 are available.

Where a given reference period is spread across two calendar years, the later year is cited. For example, the school year 2008/2009 is presented as 2009.

Literacy indicators refer to the most recent data available within the period 2005-2009. When observed data are only available prior to 2005, estimates generated with the UIS Global Age-Specific Literacy Projections Model (GALP) for 2009 are presented.

Data on educational attainment are the latest available within the period 1998-2010.

Countries that completed the joint UNESCO/OECD/Eurostat (UOE) questionnaire were requested to provide education finance and expenditure data corresponding to the financial year 2008 or the most recent year available.

Data presented in the analytical chapter may not always be included in the statistical tables but can be referenced at the UIS Data Centre: <http://stats.uis.unesco.org>

## DATA SOURCES

### Education

The UIS compiles education statistics in aggregate form from official administrative sources at the national level. These include data on educational programmes, access, participation, progression, completion, internal efficiency, and human and financial resources. They cover:

- education in pre-primary, primary, basic and secondary schools, and in colleges, universities and other tertiary education institutions;
- education in public (or state) and private sectors; and
- special needs education (both in regular and special schools).

These data are collected annually by the UIS and its partner agencies through the following three major surveys that can be downloaded from the UIS website at [www.uis.unesco.org/surveys/education](http://www.uis.unesco.org/surveys/education):

#### i) UIS survey

The UIS education questionnaires are sent to UNESCO Member States annually. The questionnaires are based on international standards, classifications and measures that are regularly reviewed and modified by the UIS in order to address emerging statistical issues and improve the quality of data.

The countries that participate in the UIS survey are listed in Annex D.

#### ii) UOE survey

UNESCO-UIS, the OECD and Eurostat (UOE) have jointly administered this annual data collection since 1993. The UOE questionnaire compiles data from high- and middle-income countries that are generally members or partner countries of the OECD or the European Union. The survey collects more detailed education statistics and allows the production of a wider set of indicators, as presented in Statistical Tables 20-29.

The countries that participate in the UOE data collection are listed in Annex D.

#### iii) WEI programme

The World Education Indicators (WEI) programme provides a platform for middle-income countries to develop a critical mass of policy-relevant indicators beyond the global core set of education statistics. This also allows for direct comparisons with countries participating in the UOE survey as the collection of data from WEI countries is based on a common set of definitions, instructions and methods.

Participating countries in the WEI data collection are: Argentina, China, Egypt, India, Indonesia, Jamaica, Jordan, Malaysia, Paraguay, Peru, the Philippines, Sri Lanka, Thailand, Tunisia and Uruguay. The UIS hosts the secretariat for the WEI programme.

### Literacy

Literacy statistics for youth aged 15 to 24 years and adults aged 15 years and older are obtained from national population censuses, household surveys and estimates using the UIS Global Age-Specific Literacy Projections Model (GALP). The UIS literacy questionnaire can be downloaded at: <http://www.uis.unesco.org/surveys/literacy>

Data sources, reference years and national definitions are available online at the UIS Data Centre. For more information on literacy estimates and projections, please refer to the report Global Age-Specific Literacy Projections Model (GALP): Rationale, Methodology and Software, available at <http://www.uis.unesco.org/publications/GALP>

## Educational attainment

Statistics on educational attainment for the population aged 25 years and older are based on national population censuses or surveys.

## Population

Population statistics for countries with at least 50,000 inhabitants are provided by the United Nations Population Division, based on the 2008 Revision of the World Population Prospects. For more information on UN Population Division estimates, please visit <http://www.un.org/esa/population/unpop.htm>

For countries where UN Population Division data are not available, the UIS derives single-year estimates from other sources, such as Eurostat (Demographic Statistics), the Secretariat of the Pacific Community (Statistics for Development Programme) and national statistical offices.

Education indicators based on population estimates by age and sex for countries with a total population under 100,000 inhabitants should be interpreted with caution due to fluctuations in migration and other factors.

Population-based indicators are listed as missing (...) when population data are not available or not considered reliable. In exceptional cases, the UIS uses national data when enrolment data collected by the UIS and population data produced by the UN Population Division are not consistent.

## Economic data

Data on economic indicators such as gross domestic product (GDP) and purchasing power parity (PPP) are based on the World Bank's World Development Indicators database of April 2011. For a small group of countries where World Bank estimates are not available, data are obtained from the United Nations Statistics Division (UNSD).

Economic-based indicators are listed as missing (...) when economic data are not available or considered reliable.

## TECHNICAL NOTES

### Education data and indicators

Regional averages are based on publishable data and estimates, as well as imputed values for missing or unpublishable data for each country within a given region.

Where the publishable data represent less than 60% of the relevant population, the regional average is regarded as a UIS estimate and marked with the symbol \*\*.

Where the publishable data represent less than 33% of the regional population, the average is not published.

Where data inconsistencies result in an indicator exceeding its theoretical maximum (e.g. 100% in the case of the net enrolment rate), it is "capped" in such a way as to maintain the same ratio between male and female values (see *Annex A*).

Due to rounding, gender parity indices (GPI) may differ from those based directly on reported values of indicators.

The percentage of females (% F) is included to provide information on the proportion of girls enrolled with respect to the total enrolment. For assessing gender parity, a more relevant measure is the GPI.

### Education finance

Expenditure on pre-primary education or from international sources – both of which are often comparatively small – have been treated as negligible in cases where data were in fact missing. In these cases, total education expenditure may be underestimated.

### Educational attainment

Data on educational attainment are presented by ISCED level. In addition to the categories related to completed education levels, three other columns are presented in Table 18:

- “No schooling” refers to the percentage of the population without any formal schooling;
- “Incomplete primary” refers to the percentage of the population that has attended primary education but not completed the level; and
- “Unknown” refers to the percentage of the population for which the educational level could not be determined.

### Population issues: Country notes

**Azerbaijan:** Education data do not cover the region of Nagorno-Karabakh, whereas UN Population Division data do. Therefore, the population data used for the calculation of indicators were provided by national authorities and exclude Nagorno-Karabakh.

**Cyprus:** Education data do not include schools that are not under government control, whereas the UN Population Division data do. Therefore, the population data used for the calculation of indicators were provided by Eurostat and only cover the population living in the government-controlled area.

**Republic of Moldova:** Education data do not cover the region of Transnistria, whereas the UN Population Division data do. Therefore, the population data used for the calculation of indicators were provided by Eurostat and exclude Transnistria.

**Serbia:** Education data do not cover Kosovo, whereas the UN Population Division data do. Therefore, the population data used for the calculation of indicators were provided by Eurostat and exclude Kosovo.

**Occupied Palestinian Territory:** Education data do not include data for East Jerusalem, whereas the UN Population Division data do. Therefore, indicators should be interpreted with caution.

**United Republic of Tanzania:** Education data do not include Zanzibar, whereas the UN Population Division data do. The population of Zanzibar is approximately 3% of the total population of Tanzania. Indicators should be interpreted with caution.

### Student mobility

Mobile students are defined as those who have crossed a national border and moved to another country with the objective to study. This group is commonly categorised by three operational definitions: i) student's country of permanent or usual residence; ii) country of prior education; or iii) country of citizenship. The UIS uses the former two to define mobile students. The Institute also accepts country of citizenship as a proxy in countries/territories where residence or prior education do not yield the country of origin of mobile students, as in the cases of: Austria, Cameroon, Chile, the Czech Republic, Finland, France, Greece, Hungary, India, Indonesia, Italy, Japan, Jordan, Kuwait, Madagascar, Malaysia, Malta, Oman, the Philippines, Poland, Qatar, the Republic of Korea, Romania, the Russian Federation, Saudi Arabia, South Africa, The former Yugoslav Republic of Macedonia and Turkey.

In order to improve the coverage of data on mobile students, the UIS includes partial data for some host countries. For statistics on outbound mobility, it is preferable to represent a host country partially rather than publishing no data. Partial data are included for the following host countries: India (universities only); Canada, Costa Rica, Kuwait and South Africa (public institutions only); and Germany and the Russian Federation (ISCED 5 only).

Data on students who are studying abroad are reported by host countries. However, many countries do not regularly report data on mobile students. In order to estimate the number of students from a given country who are studying abroad, the outbound mobility ratio (*Statistical Table 12*) as well as regional totals (*Statistical Table 11*) for the most recent year since 1999 are used to impute for missing data.

It is worth noting that substantial numbers of students from small countries enter tertiary programmes outside their country of origin. The gross outbound enrolment ratio (*Statistical Table 12*) shows the magnitude of this phenomenon.

Outbound mobile students are counted in the gross enrolment ratio of the respective host country, even if they are funded by the government of their country of origin, such as in the cases of many Caribbean and Pacific countries or territories.

#### **UOE/WEI data (Statistical Tables 20-29)**

Statistical Tables 20-29 provide an additional set of indicators based on the UOE and WEI surveys and are presented for participating countries only. These indicators are calculated by the UIS based on national data submissions.

For OECD members and partner countries (Brazil and the Russian Federation), data presented in Tables 24 and 26 are a subset of those presented in the 2011 edition of OECD's *Education at a Glance (EAG)*, available at: [www.oecd.org/edu/eag2011](http://www.oecd.org/edu/eag2011). For Chile, Estonia, Israel and Slovenia, their status as OECD partner countries changed to that of member countries in 2010.

#### **Upper secondary graduates (Table 9)**

For selected countries, data on upper secondary graduates presented in Table 9 are based on a pilot questionnaire first administered in Central Asia, Central and Eastern Europe, East Asia and the Pacific, and Latin America and the Caribbean in 2007.

## STATISTICAL TABLES

1. Pre-primary education / ISCED 0 / Enrolment and teaching staff / 1999 and 2009	92
2. Primary education / ISCED 1 / New entrants / 1999 and 2009	102
3. Primary education / ISCED 1 / Enrolment and teaching staff / 1999 and 2009	112
4. Primary education / ISCED 1 / Measures of progression and completion / 2009	122
5. Primary and lower secondary education / ISCED 1 and 2 / Compulsory education and out-of-school children / 2009	132
6. Secondary education / ISCED 2 and 3 / Measures of enrolment / 2009	144
7. Secondary education / ISCED 2 and 3 / Measures of progression and completion / 2009	156
8. Secondary and post-secondary non-tertiary education / ISCED 2, 3 and 4 / Teaching staff and post-secondary non-tertiary enrolment / 2009	166
9. Graduation and entry to upper secondary education (ISCED 3) and entry to tertiary education (ISCED 5) / 2009 (selected countries)	176
10. Tertiary education / ISCED 5 and 6 / Enrolment, graduation ratio and teaching staff / 1999 and 2009	180
11. Tertiary education / ISCED 5 and 6 / Internationally mobile students by host country and region of origin / 2009	190
12. Tertiary education / ISCED 5 and 6 / International flows of mobile students / 2009	200
13. Tertiary education / ISCED 5 and 6 / Graduates by broad fields of education / 2009	206
14. School life expectancy / 1999 and 2009	216
15. Public expenditure on education and expenditure on education by nature of spending / Financial year ending in 2009	226
16. Expenditure on education as a percentage of GDP, by sources of funds / Financial year ending in 2009	236
17. Adult and youth literacy / 2005-2009	246
18. Educational attainment of the population aged 25 years and older / Latest year available	252
19. Cumulative educational attainment of the population aged 25 years and older by ISCED level / Latest year available	262

**WEI and UOE countries**

20. Primary and secondary education / ISCED 1, 2 and 3 / Percentage of students by type of institution / 2009	272
21. Tertiary education / ISCED 5 and 6 / Percentage of students by type of institution / 2009	274
22. Primary and lower secondary education / ISCED 1 and 2 / Average class size by type of institution / 2009	276
23. Intended instruction time (average number of hours per year) for students (9 to 14 years) in public institutions / 2009	277
24. Primary and secondary education / ISCED 1, 2 and 3 / Teachers' instruction time (average number of hours per year) in public institutions / 2009	278
25. Primary and secondary education / ISCED 1, 2 and 3 / Percentage of teachers by age / 2009	284
26. Primary and secondary education / ISCED 1, 2 and 3 / Teachers' annual salaries in public institutions (in PPP US\$) / 2009	284
27. Primary and secondary education / ISCED 1, 2 and 3 / Teachers' annual salaries in public institutions as a percentage of GDP per capita / 2009	286
28. Relative percentages of public and private expenditure on educational institutions / 2009	288
29. Distribution of total public expenditure on education by destination of funds / 2009	292

To access the electronic version of the data tables, see [www.uis.unesco.org/publications/GED2011](http://www.uis.unesco.org/publications/GED2011)

<sup>(a)</sup> These countries are part of the World Education Indicators (WEI) programme and are not required to provide graduates by field of study.

<sup>(b)</sup> These countries have completed the UNESCO/OECD/Eurostat (UOE) questionnaires. Data by field of study refer to graduations rather than graduates. Please refer to the Reader's Guide for more information on the data and symbols used in each table.

All data are UIS estimates unless otherwise noted. The reference period for regional averages is 2005–2010.

Refer to the literacy metadata table on the UIS website at [www.uis.unesco.org](http://www.uis.unesco.org) for information on data sources and literacy definitions.

<sup>(a)</sup> Observed data.

<sup>(b)</sup> Literacy rates are for the population aged 16 years and older.

<sup>(c)</sup> Literacy rates are estimates for the current decade based on survey or census data from the previous decade. Refer to the metadata table for more information.

<sup>(d)</sup> Literacy rates are for the population aged 18 years and older.

<sup>(e)</sup> Youth literacy rates are from a national survey, adult literacy rates are UIS estimates.

<sup>(1)</sup> Including subsidies attributable to payments to educational institutions received from public sources.

**Notes:** To calculate private expenditures net of subsidies, subtract public subsidies (columns 5, 10, 15) from private sources (columns 4, 9, 14).

To calculate total public expenditures including public subsidies, add public subsidies (columns 5, 10, 15) to direct public sources (columns 1, 6, 11).

Please refer to the Reader's Guide for more information on the data and symbols used in each table.

<sup>(p)</sup> Public institutions only.

Please refer to the Reader's Guide for more information on the data and symbols used in each table.

**Capping.** Indicators that surpass a theoretical maximum value are adjusted using a capping factor. The maximum value is determined using raw data from related indicators. Male, female and total values are recalculated and lowered by the capping factor so that the gender parity index of the new set of values remains the same as for the original values. For instance, net enrolment rates in primary education are capped using a factor that takes into account the male and female primary school-age populations and enrolment of primary school-age boys and girls in pre-primary, primary and secondary education. If the total enrolment of primary school-age children (whether male or female) is higher than the corresponding population, all net enrolment indicators (net enrolment rate, adjusted net enrolment rate, etc.) and their derivative indicators (out-of-school rate, etc.) are capped based on the same capping factor. In this case, the capping factor is calculated by taking the maximum of male and female enrolments and dividing by the population of primary school-age of the same sex.

**Class.** A class is made up of pupils or students who are following a common course of study. Pupils/students are grouped together in a class based on the highest number of common courses, usually compulsory studies. A class is the pedagogical structure in which each pupil/student is registered. Regardless of the level of study, a pupil/student is registered in only one class. Pupils/students from different grades may be present in the same class, as occurs in one-teacher or two-teacher schools. Conversely, a school may have a number of classes for the same grade.

**Compulsory education.** The number of years or age span during which children are legally obliged to attend school.

**Duration.** The number of grades or years in a given level of education.

**Early childhood care and education (ECCE).** Programmes that, in addition to providing children with care, offer a structured and purposeful set of learning activities either in a formal institution (pre-primary or ISCED 0) or as part of a non-formal child development programme. ECCE programmes are typically designed for children aged 3 years and over, occurring before primary education, and include organised learning activities that last on average an equivalent of at least two hours per day and 100 days per year.

**Educational attainment.** The educational attainment of an individual is defined as the ISCED level corresponding to the highest educational programme completed successfully.

**Educational institutions (public and private).** Educational institutions are defined as entities that provide instructional or education-related services to individuals and other educational institutions. Whether or not an entity qualifies as an educational institution is not contingent upon which public authority (if any) has responsibility for it. These are classified as either *public* or *private* according to whether a public agency or a private entity has the ultimate power to make decisions concerning the institution's affairs.

An institution is classified as *public* if it is controlled and managed directly by a public education authority or agency; or controlled and managed either by a government agency directly or by a governing body (council, committee, etc.), most of whose members are either appointed by a public authority or elected by public franchise.

An institution is classified as *private* if it is controlled and managed by a non-governmental organisation (e.g., a church, trade union or business enterprise), or if its governing board consists mostly of members not selected by a public agency. In general, the ultimate management control over an institution rests with who has the power to determine the general activity of the school and appoint the managing officers. The extent to which an institution receives its funding from public or private sources does not determine the classification status of the institution.

A distinction is made between *government-dependent* and *independent private* institutions on the basis of the degree of a private institution's dependence on funding from government sources. A *government-dependent private institution* is one that receives at least 50% of its core funding from government agencies. An *independent private institution* is one that receives less than 50% of its core funding from government agencies. Core funding refers to the funds that support the basic educational services of the institution. It does not include funds provided specifically for research projects, payments for services purchased or contracted by private organisations, or fees and subsidies received for ancillary services such as lodging and meals. Additionally, institutions should be classified as government-dependent if their teaching staff are paid by a government agency, either directly or indirectly.

**Enrolment.** The number of pupils or students officially enrolled in a given grade or level of education, regardless of age.

**Entrance age (theoretical).** The age at which pupils or students would enter a given programme or level of education assuming they start at the official entrance age for the lowest level of education, study full-time throughout, and progress through the system without repeating or skipping a grade. The theoretical entrance age to a given programme or level is typically, but not always, the most common entrance age.

## Expenditure on education

**Total public expenditure on education.** The sum of all expenditure on education and education administration made by local, regional and national/central governments, including municipalities. Intergovernmental transfers are excluded.

**Current expenditure on education.** Expenditure for goods and services consumed within the current year and which would be renewed if needed in the following year. It includes expenditure on staff salaries, pensions and benefits; contracted or purchased services; other resources, including books and teaching materials; welfare services; and other current expenditure, such as subsidies for students and households, minor equipment, minor repairs, fuel, telecommunications, travel, insurance and rent.

**Capital expenditure on education.** Expenditure for assets that yield benefits for a period of more than one year. It includes expenditure for construction, renovation and major repairs of buildings and the purchase of heavy equipment or vehicles.

**Public subsidies.** Public subsidies to households and other private entities consist of transfers to the private sector for educational institutions and transfers for student living costs and other education-related costs that occur outside educational institutions.

*Public subsidies to households and other private entities for educational institutions* are composed of government transfers and certain other payments to students or households, insofar as these translate into payments to educational institutions for educational services (for example, fellowships, financial aid or student loans for tuition). They also include government transfers and other payments (mainly subsidies) to private entities other than households, including, for example, subsidies to firms or labour organisations that operate apprenticeship programmes and interest subsidies to private financial institutions that provide student loans, etc.

*Public subsidies to households that are not attributable to payments to educational institutions* include subsidies for student living costs and the value of special subsidies provided to students, either in cash or in kind, such as free or reduced-price travel on public transport or family allowances that are contingent on student status.

## Fields of education (broad)

### *Science and technology fields*

**Science:** life sciences; physical sciences; mathematics and statistics; computer sciences.

**Engineering, manufacturing and construction:** engineering and engineering trades; manufacturing and processing; architecture and building.

### *Other fields*

**Agriculture:** agriculture, forestry and fishery; veterinary science.

**Education:** teacher training; education science.

**Health and welfare:** medicine; medical services; nursing; dental services; social care; social work.

**Humanities and arts:** religion and theology; foreign languages and cultures; native languages; interpretation and translation; linguistics; comparative literature; history; archaeology; philosophy; ethics. Fine arts; performing arts; graphic and audio-visual arts; design; craft skills.

**Social science, business and law:** social and behavioural science; journalism and information; business and administration; law.

**Services:** personal services; transport services; environmental protection; security services.

*Basic programmes, literacy, numeracy and personal development— together with programmes for which the field is unknown—are classified as “not known or unspecified”.*

**Graduate.** A person who has successfully completed the final year of a level or sub-level of education. In some countries, completion occurs as a result of passing an examination or a series of examinations. In other countries, it occurs after a requisite number of course hours have been accumulated. Sometimes both types of completion occur within a country. For countries participating in the joint UNESCO/OECD/Eurostat (UOE) survey, graduations—instead of graduates—are used to calculate percentages by field of education (due to the UOE instrument design). Graduations refer to the number of qualifications obtained during the reference period; each qualification obtained counts as one graduation.

**Gross domestic product (GDP).** The sum of gross value added by all resident producers in the economy, including distributive trades and transport, plus any product taxes, minus any subsidies not included in the value of the products.

**GDP per capita.** The gross domestic product divided by mid-year population.

**Gross national income (GNI).** The sum of gross value added by all resident producers in the economy, including distributive trades and transport, plus any product taxes, minus any subsidies not included in the value of the products, plus net receipts of income from abroad. Since net receipts from abroad may be positive or negative, it is possible for GNI to be greater or smaller than GDP.

**Intended instruction time for students.** The number of hours per year that pupils are instructed according to the compulsory and flexible part of the intended curriculum. The total number of intended instruction hours per year is calculated by multiplying the total number of classroom sessions per year by the duration of one session. The intended curriculum is the subject matter content, as defined by the government or the education system. The intended curriculum comprises compulsory subjects, as well as the flexible part of the curriculum (subjects of the intended curriculum).

**Instruction time of teachers (teaching time).** Statutory instruction time (sometimes also referred to as teaching time) is defined as the total number of hours per year for which a full-time classroom teacher is responsible for teaching a group or class of students, according to the formal policy in the specific country. Periods of time formally allowed for breaks between lessons or groups of lessons may be excluded. Instruction/ teaching hours per year are calculated on the basis of teaching hours per day multiplied by the number of teaching days per year, or on the basis of teaching hours per week multiplied by the number of weeks per year that the school is open for teaching. The number of hours per year that fall on days when the school is closed are excluded.

**International Standard Classification of Education (ISCED).** A classification system that provides a framework for the comprehensive statistical description of national educational systems and a methodology that translates national educational programmes into internationally comparable levels of education. The basic unit of classification in ISCED is the educational programme. ISCED also classifies programmes by field of study, programme orientation and destination (*see Annex C*).

**International (or internationally mobile) students.** Students who have crossed a national or territorial border for the purpose of education and are now enrolled outside their country of origin.

**Literacy.** The ability to read and write, with understanding, a simple statement related to one's daily life. It involves a continuum of reading and writing skills, and often includes basic arithmetic skills (numeracy).

**New entrants.** Pupils or students entering a given level of education, programme or grade for the first time.

### Orientation of educational programmes

**General education.** Type of programme designed mainly to lead pupils to a deeper understanding of a subject or group of subjects, especially, but not necessarily to prepare pupils for further education at the same or higher level. These programmes are typically school-based and may contain vocational elements. Successful completion of these programmes may or may not lead to an academic qualification. However, they do not typically allow successful completers to enter a particular occupation, trade, or class of occupations or trades without further training. General education has a technical or vocational content of less than 25%, but pre-technical/pre-vocational programmes (i.e., programmes with a technical/vocational content of more than 25% that do not lead to a labour-market relevant technical or vocational qualification) are typically reported with general programmes.

**Technical and vocational education and training (TVET).** Type of programme designed mainly to lead pupils to acquire the practical skills, know-how and understanding necessary for employment in a particular occupation or trade (or class of occupations or trades). Successful completion of such programmes normally leads to a labour-market relevant technical or vocational qualification recognised by the competent authorities (e.g., Ministry of Education, employers' associations, etc.) in the country in which it is obtained.

**Purchasing power parity (PPP).** The currency exchange rates that equalise the purchasing power of different currencies. This means that a given sum of money, when converted into U.S. dollars at the PPP exchange rate (PPP dollars), will buy the same basket of goods and services in all countries. In other words, PPPs are the rates of currency conversion which eliminate the differences in price levels among countries. Thus, comparisons between countries reflect only differences in the volume of goods and services purchased.

**Repeater.** Pupil enrolled in the same grade for a second or further year.

**School-age population.** Population of the age group theoretically corresponding to a given level of education, as indicated by theoretical entrance age and duration.

**School life expectancy.** The number of years a person of school entrance age can expect to spend within the specified level of education.

## Students

**Student/pupil.** Pupil refers to a child enrolled in a basic educational programme; while pupils are always considered to be students, children, youth or adults enrolled at more advanced levels of education are more commonly referred to as students, and less often as pupils.

**Full-time students.** Students engaged in an educational programme for a number of hours of study statutorily regarded as full-time at a particular level of education in a given country.

**Part-time students.** Students whose statutory study hours are less than those required of full-time students in a given level and country.

**Full-time equivalent number of students.** Generally calculated in person-years. The unit for the measurement of full-time equivalence is a full-time student. Thus, a full-time student equals one full-time equivalent. The full-time equivalence of part-time students is determined by calculating the ratio of their hours studied to the statutory hours studied by a full-time student during the school year. For example, a student who studied one-third of the statutory hours of a full-time student equals one-third of a full-time equivalent student.

## Teachers

**Teaching staff.** Persons employed full-time or part-time in an official capacity for the purpose of guiding and directing the learning experience of pupils and students, irrespective of their qualification or the delivery mechanism (i.e., whether face-to-face or at a distance). This definition excludes educational personnel who have no active teaching duties (e.g., headmasters, headmistresses or principals who do not teach) or who work occasionally or in a voluntary capacity in educational institutions.

**Trained teachers.** Teachers who have received the minimum organized teacher training (pre-service or in-service) required for teaching at the relevant level in a given country.

**Full-time teachers.** Persons engaged in teaching for a number of hours of work statutorily regarded as full-time at the particular level of education in a given country.

**Part-time teachers.** Teachers whose statutory working hours are less than those required of full-time teachers in a given country.

**Full-time equivalent number of teachers.** Calculated in person-years. The unit for the measurement of full-time equivalence is a full-time teacher. Thus, a full-time teacher equals one full-time equivalent. The full-time equivalence of part-time teachers is determined by calculating the ratio of their hours worked to the statutory hours worked by a full-time teacher during the school year. For example, a teacher who works one-third of the statutory hours of a full-time teacher equals one-third of a full-time equivalent teacher.

**Teachers' salaries.** Expressed as statutory salaries, which are scheduled salaries according to official pay scales. They refer to the average scheduled gross salary per year for a full-time teacher with the minimum training necessary to be fully qualified at the beginning of his or her teaching career. Reported salaries are defined as the sum of wages (total sum of money paid by the employer for the labour supplied) minus the employer's contribution to social security and pension funding (according to existing salary scales). Bonuses that constitute a regular part of the salary (such as holidays or regional bonuses) are included in the figures. Additional bonuses (for example, remuneration for teachers in remote areas, for participating in school improvement projects or special activities, or for exceptional performance) are excluded from the reported gross salaries. Salaries at 15 years experience refer to the scheduled annual salary of a full-time classroom teacher with the minimum training necessary to be fully qualified and with 15 years of experience. The maximum salaries reported refer to the scheduled maximum annual salary (top of the salary scale) of a full-time classroom teacher with the minimum training to be fully qualified for his or her job. Salary data are reported in accordance with formal policies for public institutions.

For more definitions, refer to the multilingual UIS online glossary at [www.uis.unesco.org/glossary](http://www.uis.unesco.org/glossary)

**Class size.** The number of enrolled students divided by the number of classes for the whole country. To ensure comparability among countries, special needs programmes are excluded. Data include only regular programmes at primary and lower secondary levels of education and exclude teaching in sub-groups outside the regular classroom setting.

### Education finance

**Educational expenditure by nature of spending as a percentage of total educational expenditure on public institutions, by level.** Spending by nature (salaries, other current, total current or capital) expressed as a percentage of the expenditure for public educational institutions of the specified level of education. Salaries and other current expenditure add up to total current expenditure. Public subsidies to the private sector and administrative costs are excluded.

**Public expenditure per pupil or student by level as a percentage of GDP per capita.** Total public expenditure per pupil or student in the specified level of education expressed as a percentage of GDP per capita.

**Total public expenditure per pupil or student by level (PPP US\$).** Total public expenditure per pupil or student in the specified level of education expressed in U.S. dollars and adjusted in terms of purchasing power parity (PPP).

**Total expenditure on educational institutions and educational administration as a percentage of GDP, by source.** Expenditure from public, private and international sources on educational institutions (i.e., schools, universities and similar instructional institutions) and administration at a given level of education, expressed as a percentage of GDP. This indicator excludes public subsidies to the private sector. As a consequence of this, data on public expenditure on educational institutions and educational administration differ from total public expenditure on education.

**Total public expenditure on education as a percentage of GDP.** Current and capital expenditure on education by local, regional and national governments, including municipalities (household contributions are excluded), expressed as a percentage of GDP.

**Total public expenditure on education as a percentage of total government expenditure.** Current and capital expenditure on education by local, regional and national governments, including municipalities (household contributions are excluded), expressed as a percentage of total government expenditure on all sectors (including health, education, social services, etc.).

**Educational attainment of the population aged 25 years and above.** Percentage distribution of population aged 25 years and above according to the highest level of education attained or completed with reference to ISCED.

**Effective transition rate from primary to secondary general education.** The number of new entrants to the first grade of secondary education (general programmes only) in a given year expressed as a percentage of the students enrolled in the last grade of primary education in the previous year who do not repeat that grade the following year. It measures the probability that a pupil in the last grade of primary education makes the transition to secondary general education.

**Expected gross intake ratio to the last grade of primary.** Total number of new entrants to the first grade of primary education in a given year, regardless of age, who are expected to reach the last grade, regardless of repetition, expressed as a percentage of the population at the theoretical entrance age to primary education in the same year. It is calculated by multiplying the gross intake ratio to primary education by the probability of survival to the last grade. It estimates future gross intake to the last grade of primary education based on current new entrants to the first grade, assuming current grade transition and repetition rates remain unchanged. It therefore predicts the effect on last grade intake of current education policies on entrance to primary education and future years of schooling.

**Gender parity index (GPI).** The ratio of female-to-male values of a given indicator. A GPI of 1 indicates parity between sexes.

**Gross intake ratio (GIR).** Total number of new entrants to the first grade of primary education, regardless of age, expressed as a percentage of the population at the official primary school entrance age.

**Gross intake ratio to the last grade of primary.** The total number of new entrants in the last grade of primary education, regardless of age, expressed as a percentage of the population of theoretical entrance age to the last grade.

**Gross enrolment ratio (GER).** The number of pupils or students enrolled in a given level of education, regardless of age, expressed as a percentage of the population in the theoretical age group for the same level of education. For the tertiary level, the population used is the 5-year age group following the official secondary school graduation age.

**Gross entry ratio.** Total number of new entrants to a given level, regardless of age, expressed as a percentage of the population of theoretical entrance age to this level.

**Gross graduation ratio.** Total number of graduates, regardless of age, from a given level of education or programme expressed as a percentage of the population at the theoretical graduation age for that level of education or programme.

**Gross outbound enrolment ratio.** Total number of students from a given country studying abroad expressed as a percentage of the population of tertiary age in that country.

**Literacy rate.** Total number of literate persons in a given age group, expressed as a percentage of the total population in that age group. The adult literacy rate measures literacy among persons aged 15 years and above, and the youth literacy rate measures literacy among persons aged 15 to 24 years.

**Mobility ratios**

**Inbound mobility rate.** Total number of students from abroad studying in a given country, expressed as a percentage of total tertiary enrolment in that country.

**Outbound mobility ratio.** Total number of students from a given country studying abroad, expressed as a percentage of total tertiary enrolment in that country.

**Net enrolment rate (NER).** Total number of pupils or students in the theoretical age group for a given level of education enrolled in that level, expressed as a percentage of the total population in that age group.

**Adjusted primary net enrolment rate (ANER).** Total number of pupils or students of official primary school age who are enrolled in primary or secondary education, expressed as a percentage of the corresponding population. It measures actual school participation of the official primary school age population and assesses the level of achievement of the universal primary education (UPE) goal.

**Net flow of mobile students.** The number of tertiary students from abroad (inbound students) studying in a given country minus the number of students at the same level from a given country studying abroad (outbound students).

**Net flow ratio of mobile students.** Total number of tertiary students from abroad (inbound students) studying in a given country minus the number of students at the same level of education from that country studying abroad (outbound students), expressed as a percentage of total tertiary enrolment in that country.

**Net intake rate (NIR).** Total number of new entrants to the first grade of primary education who are of the theoretical primary school entrance age, expressed as a percentage of the population of the same age.

**Adjusted net intake rate (ANIR).** Total enrolment in primary education of pupils of official primary school entrance age, expressed as a percentage of the population of the same age in a given school year. It is the equivalent of the age-specific enrolment rate of the official primary entrance age. It measures the actual level of access to primary education of the population of the official primary school entrance age.

**Percentage of female pupils.** Total number of female pupils in a given level of education, expressed as a percentage of the total number of students enrolled at that level of education.

**Percentage of new entrants to primary education with ECCE experience.** Total number of new entrants to primary education who have attended some form of organised Early Childhood Care and Education (ECCE) programmes, expressed as a percentage of the total number of new entrants to primary education.

**Percentage of private enrolment.** Total number of pupils or students at a given level of education enrolled in institutions that are not operated by a public authority but controlled and managed, whether for profit or not, by a private body (e.g. non-governmental organisation, religious body, special interest group, foundation or business enterprise), expressed as a percentage of the total number of pupils or students enrolled at the given level of education.

**Percentage of repeaters.** Total number of pupils or students who are enrolled in the same grade as the previous year, expressed as a percentage of total enrolment in the given grade of education.

**Percentage of technical/vocational enrolment.** Total number of pupils or students enrolled in technical/vocational programmes at a given level of education, expressed as a percentage of the total number of pupils or students enrolled in all programmes (technical/vocational and general) at that level.

**Percentage of trained teachers.** Total number of teachers who have received the minimum organised teacher-training (pre-service or in service) required for teaching at the relevant level of education in a given country, expressed as a percentage of the total number of teachers at the given level of education.

**Pupil-teacher ratio.** The average number of pupils per teacher at a given level of education, based on headcounts of both pupils and teachers.

**Regional average.** Weighted averages for a region, taking into account the relative size of the relevant population of each country. The figures for countries with larger populations thus have a proportionately greater influence on the regional aggregates. The averages are derived from published data complemented by imputed values for missing countries. Imputations are based on publishable data for the same countries from previous and/or following years. When imputing an indicator, information from related indicators is used to strengthen the imputation hypothesis.

**School life expectancy.** The sum of age-specific enrolment rates expressed as a percentage divided by 100, for the levels of education specified. To compensate for the lack of reliable data by age for tertiary education, the gross enrolment ratio for tertiary education is multiplied by 5 and divided by 100 and used as a proxy for age-specific enrolment rates. At all other ISCED levels, enrolment that is not distributed by age is divided by the school-age population and multiplied by the duration of the given level before being added to the sum of the age-specific enrolment rates.

**Survival rates.** The percentage of a cohort of pupils or students enrolled in the first grade of a given level or cycle of education in a given school year who are expected to reach a given grade, regardless of repetition. The survival rates are calculated on the basis of the reconstructed cohort method, which uses data on enrolment by grade for two consecutive school years and repeaters by grade for the more recent year of these two years.

For more definitions, refer to the multilingual UIS online glossary at [www.uis.unesco.org/glossary](http://www.uis.unesco.org/glossary)

## Description of ISCED97 levels, classification criteria and sub-categories

<b>0 PRE-PRIMARY LEVEL OF EDUCATION</b>	<b>Main criteria</b>
Initial stage of organized instruction, designed primarily to introduce very young children to a school-type environment.	Should be centre- or school-based, be designed to meet the educational and developmental needs of children of at least 3 years of age, and have staff that are adequately trained (i.e. qualified) to provide an educational programme for children.
<b>1 PRIMARY LEVEL OF EDUCATION</b>	<b>Main criteria</b>
Normally designed to give pupils a sound basic education in reading, writing and mathematics.	Beginning of systematic studies characteristic of primary education, e.g. reading, writing and mathematics. Entry into the nationally designated primary institutions or programmes. The commencement of reading activities alone is not a sufficient criteria for classification of an educational programme at ISCED level 1.
<b>2 LOWER SECONDARY LEVEL OF EDUCATION</b>	<b>Main criteria</b>
The lower secondary level of education generally continues the basic programmes of the primary level, although teaching is typically more subject-focused, often employing more specialised teachers who conduct classes in their field of specialisation.	Programmes at the start of level 2 correspond to the point where programmes are beginning to be organised in a more subject-oriented pattern, using more specialised teachers conducting classes in their field of specialisation.  If this organizational transition point does not correspond to a natural split in the boundaries between national educational programmes, then programmes should be split at the point where national programmes begin to reflect this organisational change.
<b>3 UPPER SECONDARY LEVEL OF EDUCATION</b>	<b>Main criteria</b>
The final stage of secondary education in most countries. Instruction is often more organised along subject-matter lines than at ISCED level 2 and teachers typically need to have a higher level, or more subject-specific, qualification than at ISCED 2.	National boundaries between lower secondary and upper secondary education should be the dominant factor for splitting levels 2 and 3.  Admission into programmes at this level usually requires the completion of ISCED 2 for admission, or a combination of basic education and life experience that demonstrates the ability to handle ISCED 3 subject matter.
<b>4 POST-SECONDARY NON-TERTIARY</b>	<b>Main criteria</b>
These programmes straddle the boundary between upper secondary and post-secondary education from an international point of view, even though they might clearly be considered as upper secondary or post-secondary programmes in a national context.  They are often not significantly more advanced than programmes at ISCED 3 but they serve to broaden the knowledge of participants who have already completed a programme at level 3. The students are typically older than those in ISCED 3 programmes.  ISCED 4 programmes typically have a duration of 6 months to 2 years.	Students entering ISCED 4 programmes will typically have completed ISCED 3.
<b>5 FIRST STAGE OF TERTIARY EDUCATION</b>	<b>Classification criteria for level and sub-categories (5A and 5B)</b>
ISCED 5 programmes have an educational content more advanced than those offered at levels 3 and 4.	Entry into these programmes normally requires the successful completion of ISCED level 3A or 3B or a similar qualification at ISCED level 4A.
5A ISCED 5A programmes are largely theoretically based and are intended to provide sufficient qualifications for gaining entry into advanced research programmes and professions with high skills requirements.	<ol style="list-style-type: none"> <li>1. have a minimum cumulative theoretical duration (at tertiary level) of three years;</li> <li>2. typically require that the faculty have advanced research credentials;</li> <li>3. may involve completion of a research project or thesis;</li> <li>4. provide the level of education required for entry into a profession with high skills requirements or an advanced research programme.</li> </ol>
5B ISCED 5B programmes are generally more practical/technical/occupationally specific than ISCED 5A programmes.	<ol style="list-style-type: none"> <li>1. are more practically oriented and occupationally specific than programmes at ISCED 5A and do not prepare students for direct access to advanced research programmes;</li> <li>2. have a minimum of two years' duration;</li> <li>3. the programme content is typically designed to prepare students to enter a particular occupation.</li> </ol>
<b>6 SECOND STAGE OF TERTIARY EDUCATION (LEADING TO AN ADVANCED RESEARCH QUALIFICATION)</b>	
This level is reserved for tertiary programmes that lead to the award of an advanced research qualification. The programmes are devoted to advanced study and original research.	<ol style="list-style-type: none"> <li>1. requires the submission of a thesis or dissertation of publishable quality that is the product of original research and represents a significant contribution to knowledge;</li> <li>2. are not solely based on course-work;</li> <li>3. prepare participants for faculty posts in institutions offering ISCED 5A programmes, as well as research posts in government and industry.</li> </ol>

Auxiliary criteria	Sub-categories			
Pedagogical qualifications for the teaching staff; implementation of a curriculum with educational elements.				
<b>Auxiliary criteria</b>				
In countries where the age of compulsory attendance (or at least the age at which virtually all students begin their education) comes after the beginning of systematic study in the subjects noted, the first year of compulsory attendance should be used to determine the boundary between ISCED 0 and ISCED 1.				
<b>Auxiliary criteria</b>	<b>Destination for which the programmes have been designed to prepare students:</b>		<b>Programme orientation</b>	
<p>If there is no clear break-point for this organisational change, however, then countries should artificially split national programmes into ISCED 1 and 2 at the end of six years of primary education.</p> <p>In countries with no system break between lower secondary and upper secondary education, and where lower secondary education lasts for more than 3 years, only the first 3 years following primary education should be counted as lower secondary education.</p>	<b>A</b>	Programmes designed to prepare students for direct access to level 3 in a sequence which would ultimately lead to tertiary education, that is, entrance to ISCED 3A or 3B.	<b>General</b>	Education which is not designed explicitly to prepare participants for a specific class of occupations or trades or for entry into further vocational/technical education programmes.
	<b>B</b>	Programmes designed to prepare students for direct access to programmes at level 3C.		<b>Vocational</b>
	<b>C</b>	Programmes primarily designed for direct access to the labour market at the end of this level (sometimes referred to as 'terminal' programmes).		
<b>Modular programmes</b>	<b>Destination for which the programmes have been designed to prepare students:</b>		<b>Programme orientation</b>	
<p>An educational qualification is earned in a modular programme by combining blocks of courses, or modules, into a programme meeting specific curricular requirements.</p> <p>A single module, however, may not have a specific educational or labour market destination or a particular programme orientation.</p>	<b>A</b>	Programmes designed to provide direct access to ISCED 5A.	<b>General</b>	Education which is not designed explicitly to prepare participants for a specific class of occupations or trades or for entry into further vocational/technical education programmes.
	<b>B</b>	Programmes designed to provide direct access to ISCED 5B.		<b>Vocational</b>
	<b>C</b>	Programmes not designed to lead directly to ISCED 5A or 5B. Therefore, these programmes lead directly to the labour market, ISCED 4 programmes or other ISCED 3 programmes.		
<b>Types of programmes which can fit into level 4</b>	<b>Destination for which the programmes have been designed to prepare students:</b>		<b>Programme orientation</b>	
<p>The first type are short vocational programmes where either the content is not considered tertiary in many countries or the programmes do not meet the duration requirement for ISCED 5B – at least two years.</p> <p>These programmes are often designed for students who have completed level 3, although a formal ISCED level 3 qualification may not be required for entry.</p> <p>The second type of programmes are nationally considered as upper secondary programmes, even though entrants to these programmes will have typically already completed another upper secondary programme (i.e. second-cycle programmes).</p>	<b>A</b>	Programmes designed to provide direct access to ISCED 5A or 5B.	<b>General</b>	Education which is not designed explicitly to prepare participants for a specific class of occupations or trades or for entry into further vocational/technical education programmes.
	<b>B</b>	Programmes not designed to lead directly to ISCED 5A or 5B. These programmes lead directly to the labour market or other ISCED 4 programmes.		<b>Vocational</b>
	<b>Cumulative theoretical duration at tertiary</b>		<b>Position in the national degree and qualifications structure</b>	
	<b>A</b>	Duration categories: less than 5 years; 5 years or more.	<b>A</b>	Categories: First; Second or further.
	<b>B</b>	Duration categories: None.	<b>B</b>	Categories: None.

For a complete version of the ISCED97 classification, please see <http://www.uis.unesco.org/publications/ISCED97>

<b>ARAB STATES (20 countries or territories)</b>	
Respondents to <b>UIS</b> questionnaires:	Algeria (DZA), Bahrain (BHR), Djibouti (DJI), Iraq (IRQ), Kuwait (KWT), Lebanon (LBN), Libyan Arab Jamahiriya (LBY), Mauritania (MRT), Morocco (MAR), Occupied Palestinian Territory (PSE), Oman (OMN), Qatar (QAT), Saudi Arabia (SAU), Sudan (SDN), Syrian Arab Republic (SYR), United Arab Emirates (ARE), Yemen (YEM).
Respondents to <b>UOE</b> or <b>WEI</b> questionnaires:	Egypt (EGY), Jordan (JOR), Tunisia (TUN).
<b>CENTRAL AND EASTERN EUROPE (21 countries or territories)</b>	
Respondents to <b>UIS</b> questionnaires:	Belarus (BLR), Montenegro (MNE), Republic of Moldova (MDA), Serbia (SRB), Ukraine (UKR).
Respondents to <b>UOE</b> questionnaire:	Albania (ALB), Bosnia and Herzegovina (BIH), Bulgaria (BGR), Croatia (HRV), Czech Republic (CZE), Estonia (EST), Hungary (HUN), Latvia (LVA), Lithuania (LTU), Poland (POL), Romania (ROU), Russian Federation (RUS), Slovakia (SVK), Slovenia (SVN), The former Yugoslav Republic of Macedonia (MKD), Turkey (TUR).
<b>CENTRAL ASIA (9 countries or territories)</b>	
Respondents to <b>UIS</b> questionnaires:	Armenia (ARM), Azerbaijan (AZE), Georgia (GEO), Kazakhstan (KAZ), Kyrgyzstan (KGZ), Mongolia (MNG), Tajikistan (TJK), Turkmenistan (TKM), Uzbekistan (UZB).
<b>EAST ASIA AND THE PACIFIC (34 countries or territories)</b>	
Respondents to <b>UIS</b> questionnaires:	Brunei Darussalam (BRN), Cambodia (KHM), China, Special Administrative Region of Hong Kong (HKG), China, Special Administrative Region of Macao (MAC), Cook Islands (COK), Democratic People's Republic of Korea (PRK), Fiji (FJI), Kiribati (KIR), Lao People's Democratic Republic (LAO), Marshall Islands (MHL), Micronesia (Federated States of) (FSM), Myanmar (MMR), Nauru (NRU), Niue (NIU), Palau (PLW), Papua New Guinea (PNG), Samoa (WSM), Singapore (SGP), Solomon Islands (SLB), Timor-Leste (TLS), Tokelau (TKL), Tonga (TON), Tuvalu (TUV), Vanuatu (VUT), Viet Nam (VNM).
Respondents to <b>UOE</b> or <b>WEI</b> questionnaires:	Australia (AUS), China (CHN), Indonesia (IDN), Japan (JPN), Malaysia (MYS), New Zealand (NZL), Philippines (PHL), Republic of Korea (KOR), Thailand (THA).

<b>LATIN AMERICA AND THE CARIBBEAN (42 countries or territories)</b>	
Respondents to <b>UIS</b> questionnaires:	Anguilla (AIA), Antigua and Barbuda (ATG), Aruba (ABW), Bahamas (BHS), Barbados (BRB), Belize (BLZ), Bermuda (BMU), Bolivia (Plurinational State of) (BOL), British Virgin Islands (VGB), Cayman Islands (CYM), Colombia (COL), Costa Rica (CRI), Cuba (CUB), Dominica (DMA), Dominican Republic (DOM), Ecuador (ECU), El Salvador (SLV), Grenada (GRD), Guatemala (GTM), Guyana (GUY), Haiti (HTI), Honduras (HND), Montserrat (MSR), Netherlands Antilles (ANT), Nicaragua (NIC), Panama (PAN), Puerto Rico (PRI), Saint Kitts and Nevis (KNA), Saint Lucia (LCA), Saint Vincent and the Grenadines (VCT), Suriname (SUR), Trinidad and Tobago (TTO), Turks and Caicos Islands (TCA), Venezuela (Bolivarian Republic of) (VEN).
Respondents to <b>UOE</b> or <b>WEI</b> questionnaires:	Argentina (ARG), Brazil (BRA), Chile (CHL), Jamaica (JAM), Mexico (MEX), Paraguay (PRY), Peru (PER), Uruguay (URY).
<b>NORTH AMERICA AND WESTERN EUROPE (29 countries or territories)</b>	
Respondents to <b>UIS</b> questionnaires:	Andorra (AND), Gibraltar (GIB), Holy See (VAT), Monaco (MCO), San Marino (SMR).
Respondents to <b>UOE</b> or <b>WEI</b> questionnaires:	Austria (AUT), Belgium (BEL), Canada (CAN), Cyprus (CYP), Denmark (DNK), Finland (FIN), France (FRA), Germany (DEU), Greece (GRC), Iceland (ISL), Ireland (IRL), Israel (ISR), Italy (ITA), Liechtenstein (LIE), Luxembourg (LUX), Malta (MLT), Netherlands (NLD), Norway (NOR), Portugal (PRT), Spain (ESP), Sweden (SWE), Switzerland (CHE), United Kingdom of Great Britain and Northern Ireland (GBR), United States of America (USA).
<b>SOUTH AND WEST ASIA (9 countries or territories)</b>	
Respondents to <b>UIS</b> questionnaires:	Afghanistan (AFG), Bangladesh (BGD), Bhutan (BTN), Iran (Islamic Republic of) (IRN), Maldives (MDV), Nepal (NPL), Pakistan (PAK).
Respondents to <b>UOE</b> or <b>WEI</b> questionnaires:	India (IND), Sri Lanka (LKA).
<b>SUB-SAHARAN AFRICA (45 countries or territories)</b>	
Respondents to <b>UIS</b> questionnaires:	Angola (AGO), Benin (BEN), Botswana (BWA), Burkina Faso (BFA), Burundi (BDI), Cameroon (CMR), Cape Verde (CPV), Central African Republic (CAF), Chad (TCD), Comoros (COM), Congo (COG), Côte d'Ivoire (CIV), Democratic Republic of the Congo (COD), Equatorial Guinea (GNQ), Eritrea (ERI), Ethiopia (ETH), Gabon (GAB), Gambia (GMB), Ghana (GHA), Guinea (GIN), Guinea-Bissau (GNB), Kenya (KEN), Lesotho (LSO), Liberia (LBR), Madagascar (MDG), Malawi (MWI), Mali (MLI), Mauritius (MUS), Mozambique (MOZ), Namibia (NAM), Niger (NER), Nigeria (NGA), Rwanda (RWA), Sao Tome and Principe (STP), Senegal (SEN), Seychelles (SYC), Sierra Leone (SLE), Somalia (SOM), South Africa (ZAF), Swaziland (SWZ), Togo (TGO), Uganda (UGA), United Republic of Tanzania (TZA), Zambia (ZMB), Zimbabwe (ZWE).

## ELECTRONIC RESOURCES

### DATA CENTRE

The printed version of the *Global Education Digest* provides a subset of the internationally comparable statistics found in the UIS Data Centre, which can be accessed free of charge via the Institute's website: <http://stats.uis.unesco.org>

The Data Centre contains almost 1,000 education indicators and underlying data. It covers all levels of education from pre-primary to tertiary and includes topics such as access, participation, progression, completion, teachers and finance.

The Data Centre also includes a range of tools to facilitate data access and analysis, including:

- Country profiles highlighting key education indicators;
- Tools to build and store statistical tables and graphs; and
- UIS survey instruments, classifications and methodological documents.

### TIME SERIES

The Data Centre contains indicators and underlying data for 1999 onwards, based on the ISCED 1997 classification. In addition, the UIS incorporated a smaller set of indicators in a separate historical database, covering indicators on education participation, progression and resources for the period 1970 to 1999. Literacy rates are available since 1975.

### DATA UPDATES

The Data Centre is updated in January, April and October of each year. This report contains data from the April 2011 release. Data received from countries after this date will be incorporated into the October release.

### DOCUMENTATION AND PUBLICATIONS

All UIS publications and surveys are posted on the UIS website in different languages: <http://www.uis.unesco.org>

### ALERT SERVICE

Please consult the UIS website to subscribe to the alert service and receive an e-mail notification of new reports and data releases.

### CD-ROM

Additional electronic resources and a detailed set of raw data and indicators are available on the *Global Education Digest* CD-ROM. To order a copy, please send your request to [uis.publications@unesco.org](mailto:uis.publications@unesco.org)

The 2011 *Global Education Digest* examines trends in secondary education, which is the next great challenge for many countries approaching universal primary education. Globally, the number of children enrolled at the secondary level has tripled since 1970. Yet despite this progress, access remains limited in many countries.

This edition presents the different factors shaping the supply and demand for secondary education. Population data and enrolment ratios are compared over time to better evaluate government efforts to increase access. This lays the foundation to analyse participation and completion rates in lower and upper secondary education, before examining how gender disparities are shaping the educational attainment of boys and girls. In addition, administrative and household survey data are used to explore how the combination of different types of disparities—associated with gender, socio-economic status and geographic location—can impact the educational exposure of children who are out of school.

The report enriches the policy debates on secondary education by examining the human and financial resources devoted to the classroom experience of students. In particular, the number of secondary school teachers has risen by 50% since 1990, yet shortages persist. To help bridge these gaps, the report examines the composition, qualifications and salaries of teaching workforces before turning to the financial resources devoted to secondary education.

The Digest presents a wide range of education indicators and data for the school year ending in 2009 or the latest available year. In addition, it includes data from the World Education Indicators (WEI) programme and the UNESCO/OECD/Eurostat (UOE) data collection, which can be used to benchmark the performance of national education systems in 62 countries.

The UNESCO Institute for Statistics (UIS) is the statistical office of the United Nations Educational, Scientific and Cultural Organization (UNESCO) and is the UN depository for internationally comparable statistics in the fields of education, science and technology, culture, and communications.
